98 Human Secreted Proteins

Field of the Invention

10

This invention relates to newly identified polynucleotides and the polypeptides encoded by these polynucleotides, uses of such polynucleotides and polypeptides, and their production.

15

Background of the Invention

20

Unlike bacterium, which exist as a single compartment surrounded by a membrane, human cells and other eucaryotes are subdivided by membranes into many functionally distinct compartments. Each membrane-bounded compartment, or organelle, contains different proteins essential for the function of the organelle. The cell uses "sorting signals," which are amino acid motifs located within the protein, to target proteins to particular cellular organelles.

25

One type of sorting signal, called a signal sequence, a signal peptide, or a leader sequence, directs a class of proteins to an organelle called the endoplasmic reticulum (ER). The ER separates the membrane-bounded proteins from all other types of proteins. Once localized to the ER, both groups of proteins can be further directed to another organelle called the Golgi apparatus. Here, the Golgi distributes the proteins to vesicles, including secretory vesicles, the cell membrane, lysosomes, and the other organelles.

30

35

Proteins targeted to the ER by a signal sequence can be released into the extracellular space as a secreted protein. For example, vesicles containing secreted proteins can fuse with the cell membrane and release their contents into the extracellular space - a process called exocytosis. Exocytosis can occur constitutively or after receipt of a triggering signal. In the latter case, the proteins are stored in secretory vesicles (or secretory granules) until exocytosis is triggered. Similarly, proteins residing on the cell membrane can also be secreted into the extracellular space by proteolytic cleavage of a "linker" holding the protein to the membrane.

40

45

Despite the great progress made in recent years, only a small number of genes encoding human secreted proteins have been identified. These secreted proteins include the commercially valuable human insulin, interferon, Factor VIII, human growth hormone, tissue plasminogen activator, and erythropoietin. Thus, in light of

50

55

the pervasive role of secreted proteins in human physiology, a need exists for identifying and characterizing novel human secreted proteins and the genes that encode them. This knowledge will allow one to detect, to treat, and to prevent medical disorders by using secreted proteins or the genes that encode them.

Summary of the Invention

The present invention relates to novel polynucleotides and the encoded polypeptides. Moreover, the present invention relates to vectors, host cells, antibodies, and recombinant methods for producing the polypeptides and polynucleotides. Also provided are diagnostic methods for detecting disorders related to the polypeptides, and therapeutic methods for treating such disorders. The invention further relates to screening methods for identifying binding partners of the polypeptides.

Detailed Description

Definitions

The following definitions are provided to facilitate understanding of certain terms used throughout this specification.

In the present invention, "isolated" refers to material removed from its original environment (e.g., the natural environment if it is naturally occurring), and thus is altered "by the hand of man" from its natural state. For example, an isolated polynucleotide could be part of a vector or a composition of matter, or could be contained within a cell, and still be "isolated" because that vector, composition of matter, or particular cell is not the original environment of the polynucleotide.

In the present invention, a "secreted" protein refers to those proteins capable of being directed to the ER, secretory vesicles, or the extracellular space as a result of a signal sequence, as well as those proteins released into the extracellular space without necessarily containing a signal sequence. If the secreted protein is released into the extracellular space, the secreted protein can undergo extracellular processing to produce a "mature" protein. Release into the extracellular space can occur by many mechanisms, including exocytosis and proteolytic cleavage.

5 In specific embodiments, the polynucleotides of the invention are less than
300 kb, 200 kb, 100 kb, 50 kb, 15 kb, 10 kb, or 7.5 kb in length. In a further
10 embodiment, polynucleotides of the invention comprise at least 15 contiguous
nucleotides of the coding sequence, but do not comprise all or a portion of any intron.

5 In another embodiment, the nucleic acid comprising the coding sequence does not
contain coding sequences of a genomic flanking gene (i.e., 5' or 3' to the gene in the
15 genome).

As used herein, a "polynucleotide" refers to a molecule having a nucleic acid
sequence contained in SEQ ID NO:X or the cDNA contained within the clone
20 deposited with the ATCC. For example, the polynucleotide can contain the
nucleotide sequence of the full length cDNA sequence, including the 5' and 3'
untranslated sequences, the coding region, with or without the signal sequence, the
secreted protein coding region, as well as fragments, epitopes, domains, and variants
25 of the nucleic acid sequence. Moreover, as used herein, a "polypeptide" refers to a
15 molecule having the translated amino acid sequence generated from the
polynucleotide as broadly defined.

In the present invention, the full length sequence identified as SEQ ID NO:X
30 was often generated by overlapping sequences contained in multiple clones (contig
analysis). A representative clone containing all or most of the sequence for SEQ ID
20 NO:X was deposited with the American Type Culture Collection ("ATCC"). As
shown in Table 1, each clone is identified by a cDNA Clone ID (Identifier) and the
35 ATCC Deposit Number. The ATCC is located at 10801 University Boulevard,
Manassas, Virginia 20110-2209, USA. The ATCC deposit was made pursuant to the
terms of the Budapest Treaty on the international recognition of the deposit of
40 25 microorganisms for purposes of patent procedure.

A "polynucleotide" of the present invention also includes those
polynucleotides capable of hybridizing, under stringent hybridization conditions, to
45 sequences contained in SEQ ID NO:X, the complement thereof, or the cDNA within
the clone deposited with the ATCC. "Stringent hybridization conditions" refers to an
30 overnight incubation at 42° C in a solution comprising 50% formamide, 5x SSC (750
mM NaCl, 75 mM sodium citrate), 50 mM sodium phosphate (pH 7.6), 5x Denhardt's
50

5 solution, 10% dextran sulfate, and 20 µg/ml denatured, sheared salmon sperm DNA,
10 followed by washing the filters in 0.1x SSC at about 65°C.

Also contemplated are nucleic acid molecules that hybridize to the
polynucleotides of the present invention at lower stringency hybridization conditions.
5 Changes in the stringency of hybridization and signal detection are primarily
accomplished through the manipulation of formamide concentration (lower
15 percentages of formamide result in lowered stringency); salt conditions, or
temperature. For example, lower stringency conditions include an overnight
incubation at 37°C in a solution comprising 6X SSPE (20X SSPE = 3M NaCl; 0.2M
20 NaH_2PO_4 ; 0.02M EDTA, pH 7.4), 0.5% SDS, 30% formamide, 100 µg/ml salmon
sperm blocking DNA; followed by washes at 50°C with 1XSSPE, 0.1% SDS. In
addition, to achieve even lower stringency, washes performed following stringent
hybridization can be done at higher salt concentrations (e.g. 5X SSC).

Note that variations in the above conditions may be accomplished through the
15 inclusion and/or substitution of alternate blocking reagents used to suppress
background in hybridization experiments. Typical blocking reagents include
Denhardt's reagent, BLOTTO, heparin, denatured salmon sperm DNA, and
30 commercially available proprietary formulations. The inclusion of specific blocking
reagents may require modification of the hybridization conditions described above,
20 due to problems with compatibility.

Of course, a polynucleotide which hybridizes only to polyA+ sequences (such
as any 3' terminal polyA+ tract of a cDNA shown in the sequence listing), or to a
complementary stretch of T (or U) residues, would not be included in the definition of
"polynucleotide," since such a polynucleotide would hybridize to any nucleic acid
40 molecule containing a poly (A) stretch or the complement thereof (e.g., practically
25 any double-stranded cDNA clone).

The polynucleotide of the present invention can be composed of any
45 polynucleotide or polydeoxynucleotide, which may be unmodified RNA or
DNA or modified RNA or DNA. For example, polynucleotides can be composed of
30 single- and double-stranded DNA, DNA that is a mixture of single- and double-
stranded regions, single- and double-stranded RNA, and RNA that is mixture of
50 single- and double-stranded regions, hybrid molecules comprising DNA and RNA

5

10

15

that may be single-stranded or, more typically, double-stranded or a mixture of single- and double-stranded regions. In addition, the polynucleotide can be composed of triple-stranded regions comprising RNA or DNA or both RNA and DNA. A polynucleotide may also contain one or more modified bases or DNA or RNA backbones modified for stability or for other reasons. "Modified" bases include, for example, tritylated bases and unusual bases such as inosine. A variety of modifications can be made to DNA and RNA; thus, "polynucleotide" embraces chemically, enzymatically, or metabolically modified forms.

20

25

30

35

40

45

50

55

The polypeptide of the present invention can be composed of amino acids joined to each other by peptide bonds or modified peptide bonds, i.e., peptide isosteres, and may contain amino acids other than the 20 gene-encoded amino acids. The polypeptides may be modified by either natural processes, such as posttranslational processing, or by chemical modification techniques which are well known in the art. Such modifications are well described in basic texts and in more detailed monographs, as well as in a voluminous research literature. Modifications can occur anywhere in a polypeptide, including the peptide backbone, the amino acid side-chains and the amino or carboxyl termini. It will be appreciated that the same type of modification may be present in the same or varying degrees at several sites in a given polypeptide. Also, a given polypeptide may contain many types of modifications. Polypeptides may be branched, for example, as a result of ubiquitination, and they may be cyclic, with or without branching. Cyclic, branched, and branched cyclic polypeptides may result from posttranslation natural processes or may be made by synthetic methods. Modifications include acetylation, acylation, ADP-ribosylation, amidation, covalent attachment of flavin, covalent attachment of a heme moiety, covalent attachment of a nucleotide or nucleotide derivative, covalent attachment of a lipid or lipid derivative, covalent attachment of phosphatidylinositol, cross-linking, cyclization, disulfide bond formation, demethylation, formation of covalent cross-links, formation of cysteine, formation of pyroglutamate, formylation, gamma-carboxylation, glycosylation, GPI anchor formation, hydroxylation, iodination, methylation, myristoylation, oxidation, pegylation, proteolytic processing, phosphorylation, prenylation, racemization, selenoylation, sulfation, transfer-RNA mediated addition of amino acids to proteins such as arginylation, and ubiquitination.

(See, for instance, PROTEINS - STRUCTURE AND MOLECULAR PROPERTIES, 2nd Ed., T. E. Creighton, W. H. Freeman and Company, New York (1993); POSTTRANSLATIONAL COVALENT MODIFICATION OF PROTEINS, B. C. Johnson, Ed., Academic Press, New York, pgs. 1-12 (1983); Seifter et al., Meth Enzymol 182:626-646 (1990); Rattan et al., Ann NY Acad Sci 663:48-62 (1992).)

"SEQ ID NO:X" refers to a polynucleotide sequence while "SEQ ID NO:Y" refers to a polypeptide sequence, both sequences identified by an integer specified in Table 1.

"A polypeptide having biological activity" refers to polypeptides exhibiting activity similar, but not necessarily identical to, an activity of a polypeptide of the present invention, including mature forms, as measured in a particular biological assay, with or without dose dependency. In the case where dose dependency does exist, it need not be identical to that of the polypeptide, but rather substantially similar to the dose-dependence in a given activity as compared to the polypeptide of the present invention (i.e., the candidate polypeptide will exhibit greater activity or not more than about 25-fold less and, preferably, not more than about tenfold less activity, and most preferably, not more than about three-fold less activity relative to the polypeptide of the present invention.)

Polynucleotides and Polypeptides of the Invention

FEATURES OF PROTEIN ENCODED BY GENE NO: 1

The translation product of this gene is a human glycoprotein-associated amino acid transporter (See, e.g., Genbank Accession No. embICAA10198.11 (AJ130718); all references available through this accession are hereby incorporated by reference herein). Amino acid transport across cellular membranes is mediated by multiple transporters with overlapping specificities. The transport system L, which mediates Na⁺-independent exchange of large neutral amino acids, consists of a novel amino acid permease-related protein (LAT1 or AmAT-L-1c) which for surface expression and function requires formation of disulfide-linked heterodimers with the glycosylated heavy chain of the h4F2/CD98 surface antigen. h4F2hc also associates with other mammalian light chains, e.g. y+LAT1 from mouse and human which are

approximately 48% identical with LAT1 and thus belong to the same family of glycoprotein-associated amino acid transporters.

The novel heterodimers form exchangers which mediate the cellular efflux of cationic amino acids and the Na⁺-dependent uptake of large neutral amino acids. These transport characteristics and kinetic and pharmacological fingerprints identify them as y⁺L-type transport systems. mRNA encoding my⁺LAT1 is detectable in most adult tissues and expressed at high levels in kidney cortex and intestine. This indicates that the y⁺LAT1-4F2hc heterodimer, besides participating in amino acid uptake/secretion in many cell types, is the basolateral amino acid exchanger involved in transepithelial reabsorption of cationic amino acids; hence, its defect might be the cause of the human genetic disease lysinuric protein intolerance.

The gene encoding the disclosed cDNA is believed to reside on chromosome 14. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 14.

Preferred polypeptides comprise the following amino acid sequence:

LALYSALFSYSGWDTLN (SEQ ID NO: 237), VTEEIKNPERNLPL (SEQ ID NO: 238), IGISMPIVT (SEQ ID NO: 239), IYILTNVAYYTVL (SEQ ID NO: 240), SDAVAVTFADQ (SEQ ID NO: 241), VALSCFGGLNASI (SEQ ID NO: 242), SRLFFVGSREGHLPD (SEQ ID NO: 243), SFSYWFFVGLS (SEQ ID NO: 244), VGQLYLRWKEP (SEQ ID NO: 245), RPRPLKLSVFFPIVFC (SEQ ID NO: 246), DTINSLIGI (SEQ ID NO: 247), LLAAACICLLTFINCA YVKWGLVQDIFTYAKVLALIAVI VAGIVRLGQGASTHFENSFEGSSFAVGDIALALYSALFSYSGWDTLN YVTEEIKNPERNLPLSIGISMPIVTIYILTNVAYYTVLDMRDILASDAVAVTFADQIFGIFNWIPLSVALSCFGGLNASIVAASRLFFVGSREGHLPDAICMIHVERFTPVPSSLFNGIMALIYLCVEDIFQLNYYFSFSYWFFVGLSIVGQLYLRWKEPDRPRPLKLSVFFPIVFCLCTIFLVAVPLYSDTINSLIGIAIALSGLPFYFLIIRVPEHKRPLYLRRI VGSATRYLQVLCMSVAAEMDLEDGGEMPKQRDPKSN (SEQ ID NO: 249) and/or ATALPPKIVGSATRYLQVLCMSVAAEMDLEDGGEMPKQRDPKSN (SEQ ID NO: 248). Polynucleotides encoding these polypeptides are also provided.

Contact of cells with supernatant expressing the product of this gene has been shown to increase the permeability of the plasma membrane of THP-1 monocyte cells to calcium. Thus, it is likely that the product of this gene is involved in a signal

transduction pathway that is initiated when the product binds a receptor on the surface of the plasma membrane of both THP-1 monocytes, in addition to other cell-lines or tissue cell types. Thus, polynucleotides and polypeptides have uses which include, but are not limited to, activating monocytes.

This gene is expressed primarily in endothelial cells and brain, and, to a lesser extent, in a wide variety of human tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, disorders of the neural or gastrointestinal systems. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the circulation system or central nervous system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, gastrointestinal, cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 124 as residues: Glu-102 to Asn-110, Arg-256 to Leu-266, Pro-316 to Trp-328, Pro-331 to Arg-336, Met-350 to Gly-358. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in brain combined with its homology to a amino acid transporter and biological activity of increasing ion flux in monocytes indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease,

Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:11 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1550 of SEQ ID NO:11, b is an integer of 15 to 1564, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:11, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 2

The gene encoding the disclosed cDNA is believed to reside on the X chromosome. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for the X chromosome.

Preferred polypeptides of the invention comprise the following amino acid sequence:

AARGSGVRDPLEEA $\dot{\vee}$ CPFSDLQLHAGRTTALFKAVRQGHLSLQRLLLSFVCL
CPAPRGGAYRGRQASLSCGGLHPVRASRLCLPKQAWAMAGAPPPVSLPPCS
LISDCCASNQRDSVG (SEQ ID NO: 250). Polynucleotides encoding these
polypeptides are also provided.

This gene is expressed primarily in cord blood cells, and, to a lesser extent, in
frontal lobe of the brain.

Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, developmental, reproductive, hematopoietic or neural disorders.
Similarly, polypeptides and antibodies directed to these polypeptides are useful in
providing immunological probes for differential identification of the tissue(s) or cell
type(s). For a number of disorders of the above tissues or cells, particularly of the
immune and central nervous systems, expression of this gene at significantly higher or
lower levels is routinely detected in certain tissues or cell types (e.g., immune,
developmental, or cancerous and wounded tissues) or bodily fluids (e.g., lymph,
amniotic fluid, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue
or cell sample taken from an individual having such a disorder, relative to the
standard gene expression level, i.e., the expression level in healthy tissue or bodily
fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 125 as residues: His-56 to Gln-65, Leu-80 to Ile-85.
Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in cord blood cells indicates polynucleotides and
polypeptides corresponding to this gene are useful for the treatment and diagnosis of
hematopoietic related disorders such as anemia, pancytopenia, leukopenia,
thrombocytopenia or leukemia since stromal cells are important in the production of
cells of hematopoietic lineages. Representative uses are described in the "Immune
Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19,
20, and 27, and elsewhere herein. Briefly, the uses include bone marrow cell ex-vivo
culture, bone marrow transplantation, bone marrow reconstitution, radiotherapy or
chemotherapy of neoplasia.

5 The gene product may also be involved in lymphopoiesis, therefore, it can be
used in immune disorders such as infection, inflammation, allergy, immunodeficiency
10 etc. In addition, this gene product may have commercial utility in the expansion of
stem cells and committed progenitors of various blood lineages, and in the
5 differentiation and/or proliferation of various cell types. Alternatively,
polynucleotides and polypeptides corresponding to this gene are useful for the
15 diagnosis and treatment of cancer and other proliferative disorders. Expression within
embryonic tissue and other cellular sources marked by proliferating cells indicates
that this protein may play a role in the regulation of cellular division. Similarly,
20 embryonic development also involves decisions involving cell differentiation and/or
apoptosis in pattern formation. Thus, this protein may also be involved in apoptosis or
tissue differentiation and could again be useful in cancer therapy. Furthermore, the
protein may also be used to determine biological activity, to raise antibodies, as tissue
25 markers, to isolate cognate ligands or receptors, to identify agents that modulate their
interactions, in addition to its use as a nutritional supplement. Protein, as well as,
15 antibodies directed against the protein may show utility as a tumor marker and/or
immunotherapy targets for the above listed tissues.

30 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
20 related to SEQ ID NO:12 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
35 excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
40 formula of a-b, where a is any integer between 1 to 1743 of SEQ ID NO:12, b is an
25 integer of 15 to 1757, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:12, and where b is greater than or equal to a + 14.

45 FEATURES OF PROTEIN ENCODED BY GENE NO: 3

30 This gene is expressed primarily in human T cell lymphomas.

Therefore, polynucleotides and polypeptides of the invention are useful as
50 reagents for differential identification of the tissue(s) or cell type(s) present in a

5 biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, T cell lymphoma, immunodeficiencies, in addition to other immune
10 system disorders. Similarly, polypeptides and antibodies directed to these
polypeptides are useful in providing immunological probes for differential
5 identification of the tissue(s) or cell type(s). For a number of disorders of the above
tissues or cells, particularly of the immune system, expression of this gene at
15 significantly higher or lower levels is routinely detected in certain tissues or cell types
(e.g., immune, or cancerous and wounded tissues) or bodily fluids (e.g., lymph,
serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample
20 taken from an individual having such a disorder, relative to the standard gene
expression level, i.e., the expression level in healthy tissue or bodily fluid from an
individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic
25 epitopes shown in SEQ ID NO: 126 as residues: Met-1 to Phe-10. Polynucleotides
15 encoding said polypeptides are also provided.

The tissue distribution in human T cell lymphomas indicates polynucleotides
and polypeptides corresponding to this gene are useful for the diagnosis and treatment
30 of a variety of immune system disorders. Representative uses are described in the
"Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14,
20 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene
product indicates a role in regulating the proliferation; survival; differentiation; and/or
35 activation of hematopoietic cell lineages, including blood stem cells. This gene
product is involved in the regulation of cytokine production, antigen presentation, or
other processes suggesting a usefulness in the treatment of cancer (e.g., by boosting
40 25 immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene
product is involved in immune functions. Therefore it is also used as an agent for
45 immunological disorders including arthritis, asthma, immunodeficiency diseases such
as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
30 bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
50 tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity

5 disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic
lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
10 Disease, scleroderma and tissues. Moreover, the protein may represent a secreted
factor that influences the differentiation or behavior of other blood cells, or that
5 recruits hematopoietic cells to sites of injury. In addition, this gene product may have
commercial utility in the expansion of stem cells and committed progenitors of
15 various blood lineages, and in the differentiation and/or proliferation of various cell
types. Furthermore, the protein may also be used to determine biological activity,
raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify
20 agents that modulate their interactions, in addition to its use as a nutritional
supplement. Protein, as well as, antibodies directed against the protein may show
utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
25 available and accessible through sequence databascs. Some of these sequences are
related to SEQ ID NO:13 and may have been publicly available prior to conception of
30 the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
20 formula of a-b, where a is any integer between 1 to 1359 of SEQ ID NO:13, b is an
integer of 15 to 1373, where both a and b correspond to the positions of nucleotide
35 residues shown in SEQ ID NO:13, and where b is greater than or equal to a + 14.

40 FEATURES OF PROTEIN ENCODED BY GENE NO: 4

25 The protein product of this clone shares sequence homology with the C-
terminus of a human N-acetylglucosamine-phosphate mutase (See, e.g., Genbank
Accession No. ghlAAC72409.11 (AF102265); all references available through this
45 accession are hereby incorporated by reference herein.) Hofmann, et al. (Eur. J.
Biochem. 221:741-747 (1994)) studied the N-acetylglucosamine-phosphate mutase of
30 *Saccharomyces cerevisiae* and showed it to be essential for viability. A *S. cerevisiae*
agm1 deletion mutant progressed through only approximately five cell cycles to form
50 a 'string' of undivided cells with an abnormal cell morphology resembling

glucosamine auxotrophic mutants. Expression of the AGM1 gene on a multi-copy plasmid led to a significantly increased N-acetylglucosamine-phosphate mutase activity. Unlike over-expression of the *S. cerevisiae* AGM1 gene in a phosphoglucomutase (pgm1 delta/pgm2 delta) double deletion mutant which could restore phosphoglucomutase activity, over-expression of the PGM2 gene encoding the major isoenzyme of phosphoglucomutase did not increase N-acetylglucosamine-phosphate-mutase activity and did not restore growth of agm1 deletion mutant cells. These observations indicate that the different hexosephosphate mutases of *S. cerevisiae* have partially overlapping substrate specificities but, nevertheless, distinct physiological functions. The human N-acetylglucosamine-phosphate-mutase is expected to share at least some biological activities with the Agm1 protein.

Preferred polypeptide fragments of the invention comprise the following amino acid sequences: LSKAFLDSPNRLLA VEMNTDHLRLTV PNGIGALKLRXM EHYFSQGLSVQLFNDGSKGKLNHLCGADFVKSHQKPPQGMEIKSNERCCSFD GDADRIVYYHDADGHFHLIDGDKIATLISSFLKELLVEIGESLNIGVVQTAYA NGSSSTRYLEEVMKVPVYCTKTGVKHLHHKAQEFDIGVYFEANGHTALFST AVEMKIKQSAEQLEDKKRKAAMLENIIDLNFQAAGDAISDMLVIEAILALK GLTVQQWDALYTDLPNRQLKVQVADRRVISTTXAERQAVTPPGLQEAINDL VKKYKLSRAFVRPSGTEDVVRVYAEADSQESADHLAHEVSLAVFQLAGGIGE RPQPGF (SEQ ID NO: 251), LSKAFLDSPNRLLA VEMNTDHLRLTV (SEQ ID NO: 252), PNGIGALKLRXMEHYFSQGLSVQLFNDG (SEQ ID NO: 253), SKGKLNHLCGADFVKSHQKPPQGMEIKS (SEQ ID NO: 254), NERCCSFDGDADRIV YYYHDADGHFHLI (SEQ ID NO: 255), DGDKIATLISSFLKELLVEIGESLNIGV (SEQ ID NO: 256), VQTAYANGSSSTRYLEEVMKVPVYCTKTG (SEQ ID NO: 257), VKHLHHKAQEFDIGVYFEANGHTALFS (SEQ ID NO: 258), TAVEMKIKQSAEQLEDKKRKAAMLENI (SEQ ID NO: 259), IDLNFQAAGDAISDMLVIEAILALKGLT (SEQ ID NO: 260), VQQWDALYTDLPNRQLKVQVADRR VIST (SEQ ID NO: 261), TXAERQAVTPPGLQEAINDLVKKYKLSR (SEQ ID NO: 262), AFVRPSGTEDVVRVYAEADSQESA (SEQ ID NO: 263), and/or DHLAHEVSLAVFQLAGGIGERPQPGF (SEQ ID NO: 264). Polynucleotides encoding these polypeptides are also provided.

5

The gene encoding the disclosed cDNA is believed to reside on chromosome 6. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 6.

10

This gene is expressed primarily in fetal brain, and, to a lesser extent, in a wide variety of human tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, developmental disorders, particularly of the central nervous system. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the central and peripheral nervous system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

15

20

25

30

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 127 as residues: Asn-36 to Lys-42, Lys-53 to Gln-60, Ile-64 to Ala-77, Ala-128 to Tyr-135, Lys-184 to Ala-199, Leu-245 to Leu-250. Polynucleotides encoding said polypeptides are also provided.

35

40

The tissue distribution of N-acetylglucosamine-phosphate mutase in fetal brain indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital

45

50

55

malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO: 14 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 3726 of SEQ ID NO:14, b is an integer of 15 to 3740, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:14, and where b is greater than or equal to a + 14.

25 FEATURES OF PROTEIN ENCODED BY GENE NO: 5

This gene is expressed primarily in human stomach and stomach tumor cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, disorders of the gastrointestinal system, particularly cancer or ulcers of stomach tissue. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the

5 tissue(s) or cell type(s). For a number of disorders of the above tissues or cells,
particularly of the digestive system, expression of this gene at significantly higher or
10 lower levels is routinely detected in certain tissues or cell types (e.g., gastrointestinal,
or cancerous and wounded tissues) or bodily fluids (e.g., bile, lymph, serum, plasma,
5 urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an
individual having such a disorder, relative to the standard gene expression level, i.e.,
15 the expression level in healthy tissue or bodily fluid from an individual not having the
disorder.

The tissue distribution in tumors of the stomach indicates that polynucleotides
10 and polypeptides corresponding to this gene are useful for diagnosis, treatment and
intervention of these tumors, in addition to other tumors where expression has been
indicated. Additionally, the protein product of this gene may play a role in the normal
function of the stomach and/or digestive system. Furthermore, the protein may also be
25 used to determine biological activity, to raise antibodies, as tissue markers, to isolate
cognate ligands or receptors, to identify agents that modulate their interactions, in
15 addition to its use as a nutritional supplement. Protein, as well as, antibodies directed
against the protein may show utility as a tumor marker and/or immunotherapy targets
30 for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
20 available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO: 15 and may have been publicly available prior to conception of
35 the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
40 25 more polynucleotides comprising a nucleotide sequence described by the general
formula of a-b, where a is any integer between 1 to 1182 of SEQ ID NO: 15, b is an
integer of 15 to 1196, where both a and b correspond to the positions of nucleotide
45 residues shown in SEQ ID NO: 15, and where b is greater than or equal to a + 14.

30 FEATURES OF PROTEIN ENCODED BY GENE NO: 6

Preferred polypeptides of the invention comprise the following amino acid
50 sequences:

SGSKHKISFLCDDLTRLWMNVEKP (SEQ ID NO: 265). Polynucleotides encoding
these polypeptides are also provided.

15 This gene is expressed primarily in placenta, and to a lesser extent in, prostate
and ovary.

20 Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, male and female infertility, and associated disorders of the
25 reproductive system. Similarly, polypeptides and antibodies directed to these
polypeptides are useful in providing immunological probes for differential
identification of the tissue(s) or cell type(s). For a number of disorders of the above
tissues or cells, particularly of the reproductive system, expression of this gene at
significantly higher or lower levels is routinely detected in certain tissues or cell types
30 (e.g., reproductive, or cancerous and wounded tissues) or bodily fluids (e.g., lymph,
amniotic fluid, seminal fluid, serum, plasma, urine, synovial fluid and spinal fluid) or
another tissue or cell sample taken from an individual having such a disorder, relative
to the standard gene expression level, i.e., the expression level in healthy tissue or
bodily fluid from an individual not having the disorder.

35 The tissue distribution of this gene in the prostate, placenta and ovary
indicates that polynucleotides and polypeptides corresponding to this gene are useful
for treatment, prevention, and/or diagnosis of male or female infertility, endocrine

disorders, fetal deficiencies, ovarian failure, amenorrhea, ovarian cancer, benign prostate hyperplasia and prostate cancer. Similarly, the tissue distribution indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of cancer and other proliferative disorders. Expression within placental tissue and other cellular sources marked by proliferating cells indicates that this protein may play a role in the regulation of cellular division. Similarly, embryonic development also involves decisions involving cell differentiation and/or apoptosis in pattern formation. Thus, this protein may also be involved in apoptosis or tissue differentiation and could again be useful in cancer therapy. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:16 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2195 of SEQ ID NO:16, b is an integer of 15 to 2209, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:16, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 7

The translation product of this gene shares homology with the human and rat HNK-1 sulfotransferase protein (See, e.g., Genbank Accession Nos. gblAAB88123.11 (AF022729) and gil2921306/gblAAC04707.11 (AF033827); all references available through these accessions are hereby incorporated herein by reference.) Ong E, et al. (J Biol Chem. 273(9):5190-5 (1998)) have characterized the human HNK-1 sulfotransferase, and show that it is involved in the synthesis of the HNK-1

carbohydrate epitope which is expressed on various adhesion molecules in the nervous system and on immune cells (e.g., natural killer cells) and is suggested to play a role in cell-cell and cell-substratum interactions. Based on the sequence similarity, the translation product of this gene is expected to share at least some biological activities with HNK-1 sulfotransferase proteins. Such activities are known in the art, some of which are described elsewhere herein, or in, for example, Bakker, et al., J Biol Chem. 272:29942-6 (1997), incorporated herein by reference. Based on sequence similarity between sulfotransferases, a consensus sequence for the active site was developed (Ong, et al., supra). The consensus pattern is as follows: xxRPDzzzz, where x represents hydrophobic amino acid residues and z represents any amino acid residue. Therefore,

Preferred polypeptides of the invention comprise the following amino acid sequences: FVRDPFVRL (SEQ ID NO: 267), FLFVRDPFVRLIS (SEQ ID NO: 268), FLFVRDPFVRLISAF (SEQ ID NO: 269), and/or YLHTSF SRPHTGPPLPTPG PDRDREL TADSDVDFDLKFLSAGVKQSDLPRKETEQPPAPGSMEENVRGY DWSPRDARRSPDQGRQQAERRSVLRGFCANSSLAFTKERAFDDIPNSEL SHL IVDDRHGAIYCYVPKVACTNWKRVMIVLSGSLH RGAPYRDPLRIPREHVH NASAHLTFNKFWRRYGKLSRHLMKVKLKKYTKFLFVRDPFVRLISAFRSK FELENEEFYRKFAVPMRLRYANHTSLPASAREAFRAGLKVSFANFIQYLLDPH TEKLAPFNEHWRQVYRLCHPCQIDYDFVGKLETLEDAAQLQLLQVDRQ LRFPPSYRNRTASSWEEDWFAKIPLAWRQQLYKLYEADFVLFGYPKPENLL RD (SEQ ID NO: 270). Polynucleotides encoding these polypeptides are also provided.

Further preferred are the sulfotransferase active site polypeptides listed above, and at least 5, 10, 15, 20, 25, 30, 50, or 75 additional contiguous amino acid residues of the sequence referenced in Table I for this gene. The additional contiguous amino acid residues is N-terminal or C-terminal to the sulfotransferase active site polypeptides. Alternatively, the additional contiguous amino acid residues is both N-terminal and C-terminal to the sulfotransferase active site polypeptides, wherein the total N- and C-terminal contiguous amino acid residues equal the specified number. The above preferred polypeptide domains are characteristic of a signature specific to sulfotransferase proteins. The nucleotides sequence of this gene was found to be

homologous to the human hypoxanthine guanine phosphoribosyl transferase 2 cDNA which is known to be involved in the purine salvage pathway resulting in the maintenance of homeostatic levels of uric acid (See Genbank Accession No. T30127).

The gene encoding the disclosed cDNA is believed to reside on chromosome

7. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 7.

This gene is expressed to a very high level in HL-60 myelogenous leukemia cell lines, and to a lesser extent, in most cell types of the immune system.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune, myelopoiesis, and metabolic disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune and hematopoietic systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, metabolic, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 130 as residues: Ser-39 to Gly-46, Leu-49 to Ala-62, Lys-79 to Ala-93, Gly-95 to Asp-105, Ser-107 to Val-127, Gly-193 to Leu-200, Lys-218 to Ser-227, Lys-234 to Thr-239, Pro-366 to Asp-379, Pro-406 to Asp-414. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in HL-60 myelogenous leukemia cell lines and homology to HNK-1 sulfotransferase proteins indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis, prevention and/or treatment of a variety of immune system disorders, including but not limited to, those involving the HNK-1 carbohydrate epitope, (e.g. HNK-1 as an auto-antigen

5 in peripheral demyelinating neuropathy). Representative uses are described in the
"Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14,
10 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, expression of this gene product
in tonsils indicates a role in regulating the proliferation; survival; differentiation;
5 and/or activation of hematopoietic cell lineages, including blood stem cells. This gene
product is involved in the regulation of cytokine production, antigen presentation, or
15 other processes suggesting a usefulness in the treatment of cancer (e.g., by boosting
immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene
20 product is involved in immune functions. Therefore it is also used as an agent for
immunological disorders including arthritis, asthma, immunodeficiency diseases such
as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
25 bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
15 tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic
30 lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
Disease, scleroderma and tissues. Moreover, the protein may represent a secreted
factor that influences the differentiation or behavior of other blood cells, or that
20 recruits hematopoietic cells to sites of injury. In addition, this gene product may have
commercial utility in the expansion of stem cells and committed progenitors of
35 various blood lineages, and in the differentiation and/or proliferation of various cell
types. Alternatively, the homology to a conserved purine metabolism protein may
suggest that polynucleotides and polypeptides corresponding to this gene are useful
40 25 for the diagnosis, prevention, and/or treatment of various metabolic disorders such as
Tay-Sach's Disease, phenylketonuria, galactosemia, porphyrias, Hurler's syndrome,
and various urogenital disorders related to metabolic conditions, particularly Lesch-
45 Nyhan syndrome. Furthermore, the protein may also be used to determine biological
activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors,
30 to identify agents that modulate their interactions, in addition to its use as a nutritional
supplement. Protein, as well as, antibodies directed against the protein may show
50 utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:17 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1760 of SEQ ID NO:17, b is an integer of 15 to 1774, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:17, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 8

When tested against Jurkat T-cell lines, supernatants removed from cells containing this gene activated the gamma activating sequence (GAS) promoter element. GAS is a promoter element found upstream of many genes which are involved in the Jak-STAT pathway, a large, signal transduction pathway involved in the differentiation and proliferation of cells. Therefore, activation of the Jak-STAT pathway, reflected by the binding of the GAS element, can be used to indicate proteins involved in the proliferation and differentiation of cells. Thus, it is likely that this gene activates T-cells through the Jak-STAT signal transduction pathway.

In a specific embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: KLVRLQVPVRNSRVDPRVRSKIGSRRWMLQLI
MQLGSVLLTRCPFWGCFSQLMLYAERAEARRKPDIPVPLYFDMGAAVLCA
SFMSFGVKRRWFALGAALQLAISTYAAAYIGGYVHYGDWLKVRMYSRTVAII

YLNHLPGGELMIQLFFVLYGILALAFLSGYYVTLAAQILAVLLPPVMILLIDG
NVAYWHNTRRVEFWNQMKLLGESVGIFGTAVILATDG (SEQ ID NO: 271).

A preferred polypeptide fragment of the invention comprises the following amino acid sequence: MQLGSVLLTRCPFWGCFSQLMLYAERAEARRKPDIPV
PLYFDMGAAVLCASFMSFGVKRRWFALGAALQLAISTYAAAYIGGYVHYGD

The gene encoding the disclosed cDNA is believed to reside on chromosome 17. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 17.

This gene is expressed primarily in endometrial tumors, and to a lesser extent, in T-cells, pituitary and to a certain extent in most cell types.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, female reproductive, immune, or endocrine disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the reproductive and/or immune systems expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, reproductive, or cancerous and wounded tissues) or bodily fluids (e.g., amniotic fluid, lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 131 as residues: Ala-27 to Asp-34, Tyr-116 to Leu-125. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution predominantly in the endometrium indicates that polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of a range of immune and/or reproductive disorders including endometriosis, endometritis, and endometrioma. Similarly, the tissue distribution in T-cells and the ability of supernatants expressing this gene to stimulate the GAS promoter element in T-cells indicates polynucleotides and

5 polypeptides corresponding to this gene are useful for the diagnosis and treatment of a
variety of immune system disorders. Representative uses are described in the
10 "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14,
16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene
5 product indicates a role in regulating the proliferation; survival; differentiation; and/or
activation of hematopoietic cell lineages, including blood stem cells. This gene
15 product is involved in the regulation of cytokine production, antigen presentation, or
other processes suggesting a usefulness in the treatment of cancer (e.g., by boosting
immune responses).

20 10 Since the gene is expressed in cells of lymphoid origin, the natural gene
product is involved in immune functions. Therefore it is also used as an agent for
immunological disorders including arthritis, asthma, immunodeficiency diseases such
as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
25 bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
15 such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic
30 lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
Disease, scleroderma and tissues. Moreover, the protein may represent a secreted
20 factor that influences the differentiation or behavior of other blood cells, or that
recruits hematopoietic cells to sites of injury. In addition, this gene product may have
35 commercial utility in the expansion of stem cells and committed progenitors of
various blood lineages, and in the differentiation and/or proliferation of various cell
types. Alternatively, the tissue distribution in pituitary indicates polynucleotides and
40 25 polypeptides corresponding to this gene are useful for the detection, treatment, and/or
prevention of various endocrine disorders and cancers. Representative uses are
described in the "Biological Activity", "Hyperproliferative Disorders", and "Binding
45 Activity" sections below, in Example 11, 17, 18, 19, 20 and 27, and elsewhere herein.
Briefly, the protein can be used for the detection, treatment, and/or prevention of the
30 Addison's Disease, Cushing's Syndrome, and disorders and/or cancers of the pancreas
(e.g., diabetes mellitus), adrenal cortex, ovaries, pituitary (e.g., hyper-

hypopituitarism), thyroid (e.g., hyper-, hypothyroidism), parathyroid (e.g., hyper-, hypoparathyroidism), hypothalamus, and testes.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO: 18 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1660 of SEQ ID NO: 18, b is an integer of 15 to 1674, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO: 18, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 9

Contact of cells with supernatant expressing the product of this gene has been shown to increase the permeability of the plasma membrane of the myeloid leukemia cell line AML-193 to calcium. Thus, it is likely that the product of this gene is involved in a signal transduction pathway that is initiated when the product binds a receptor on the surface of the plasma membrane of myeloid leukemia cells, in addition to other cell-lines or tissue cell types. Thus, polynucleotides and polypeptides have uses which include, but are not limited to, activating myeloid leukemia cells.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: SNEILLSFPQNYIQWLNGLHGLWNLASLFS NLCLFVLMPPFAFFLESEGFAGLKKGIRARILETLVMLLLLALLILGIVWVAS ALIDNDAASMESLYDLWEFYLPYLYSCISLMGCLLLLCTPVGLSRMFTVMG HLLVKPTILEDLDEQIYIITLEEEALQRRNLGLSSSVYINIMELEQELENVKTL KTKLERRKKASAWERNLVYPVAVMVLIIETISIVLLVACNILCLLVDETAM PKGTRGPGIGNASLSTFGFVGAALHILIFYLMVSSVVGIFYSLRFFGNFTPKKD DTTMTKIIGNCVSILVLSSALPVMSTRTLGITRFDLLGDFGRFNWLGNFYIVLS YNLLFAIVTTLCLVRKFTSAVREELFKALGLHKLHLPNTSRDSETAKPSVNGH

5 QKAL (SEQ ID NO: 273). Polynucleotides encoding these polypeptides are also
provided.

10 This gene is expressed primarily in fetal heart, and to a lesser extent, in colon
and the adult pulmonary system.

5 Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
15 biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, heart, lung and digestive disorders. Similarly, polypeptides and
antibodies directed to these polypeptides are useful in providing immunological
20 probes for differential identification of the tissue(s) or cell type(s). For a number of
disorders of the above tissues or cells, particularly of the cardiovascular, pulmonary
and digestive systems, expression of this gene at significantly higher or lower levels is
routinely detected in certain tissues or cell types (e.g., developmental, cardiovascular,
25 or cancerous and wounded tissues) or bodily fluids (e.g., lymph, amniotic fluid,
serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample
15 taken from an individual having such a disorder, relative to the standard gene
expression level, i.e., the expression level in healthy tissue or bodily fluid from an
individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic
20 epitopes shown in SEQ ID NO: 132 as residues: Glu-67 to Asn-74, Glu-88 to Asn-93,
Lys-95 to Ala-107, Ala-147 to Arg-153, Phe-197 to Thr-205, Pro-292 to His-308.
35 Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in fetal heart, colon and pulmonary tissues and the
biological activity in increasing the permeability of the plasma membrane of the
40 myeloid leukemia cell line AML-193 to calcium, likely indicating that the product of
this gene is involved in a signal transduction pathway that is initiated when the
product binds a receptor on the surface of the plasma membrane of myeloid leukemia
45 cells, indicates that polynucleotides and polypeptides corresponding to this gene are
useful for the treatment, prevention, and/or detection of a range of disorders including
30 a variety of vascular disorders and conditions, which include, but are not limited to
microvascular disease, vascular leak syndrome, aneurysm, stroke, embolism,
myocardial infarction, myocarditis, ischemia, thrombosis, coronary artery disease,
50

arteriosclerosis, and/or atherosclerosis; pulmonary edema and embolism, bronchitis and/or cystic fibrosis; Crohn's Disease and/or colon cancer. Similarly, the tissue distribution indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of cancer and other proliferative disorders. Expression within embryonic tissue and other cellular sources marked by proliferating cells indicates that this protein may play a role in the regulation of cellular division. Similarly, embryonic development also involves decisions involving cell differentiation and/or apoptosis in pattern formation. Thus this protein may also be involved in apoptosis or tissue differentiation and could again be useful in cancer therapy. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:19 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2004 of SEQ ID NO:19, b is an integer of 15 to 2018, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:19, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 10

The protein product of this clone shares sequence homology with the human MaxiK channel beta 2 subunit (See, Genbank Accession No. gblAAD23380.11AF099137_1 (AF099137); all references available through this accession are hereby incorporated herein by reference), which is believed to be a modulatory subunit of the voltage and Ca²⁺ activated K⁺ (MaxiK) channel. Additionally, this protein shares homology to the human calcium-activated potassium

channel beta subunit, which, when combined with its corresponding alpha subunit and modulating peptide, are believed to be useful in treating asthma, angina, hypertension, incontinence, migraine, irritable bowel syndrome (IBS). The subsequent heteromultimer that forms upon combining the alpha, beta, and modulator subunits are also thought to be useful in preventing premature labour, preventing and treating cerebral ischemia, inducing pain modulation and decreasing neurogenic inflammation in a patient (See GeneSeq Accession No. R85306).

Preferred polypeptides comprise the soluble domain which consists of the following amino acid sequence: RSYMQSVWTEESQCTLLNASITETFNCSFSCGP.
DCWKLSQYPCLQVYVNLTSSEKLLLYHTEETIKINQKCSYIPKCGKNFEESM
SLVNVVMENFRKYQHFSCYSDPEGNQKSVILTKLYSSNVL.FHSLFWPTCMMA
GGVAIVAMVKLTQYLSLLGERIQRINR (SEQ ID NO: 274). Polynucleotides encoding these polypeptides are also provided. Based on the sequence similarity, the translation product of this gene is expected to share at least some biological activities with modulatory subunits of voltage and Ca²⁺ activated K⁺ channel proteins. Such activities are known in the art, some of which are described in Wallner, et al., PNAS 96:4137-4142 (1999), incorporated herein by reference.

This gene is expressed primarily in adrenal gland tumor, and to a lesser extent, in Hodgkin's lymphoma.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, endocrine and immune disorders, particularly Hodgkin's Lymphoma. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune and/or endocrine systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, endocrine, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression

level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 133 as residues: Trp-25 to Gln-30, Pro-50 to Gln-57, Pro-93 to Glu-101, Arg-114 to Cys-121, Ser-123 to Gln-129, Ile-177 to Arg-182. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in adrenal gland tumor and its identification as the modulatory subunit of the voltage and Ca^{2+} activated K^{+} (MaxiK) channel indicates that polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of various endocrine disorders and cancers, particularly Addison's Disease, Cushing's Syndrome, and disorders and/or cancers of the pancreas (e.g., diabetes mellitus), adrenal cortex, ovaries, pituitary (e.g., hyper-, hypopituitarism), thyroid (e.g., hyper-, hypothyroidism), parathyroid (e.g., hyper-, hypoparathyroidism), hypothalamus, and testes. Alternatively, expression in proliferative immune tissues combined with its homology to a novel human K channel indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of a variety of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product in Hodgkin's lymphoma indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g., by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also used as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity

5 disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic
lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
10 Disease, scleroderma and tissues. Moreover, the protein may represent a secreted
factor that influences the differentiation or behavior of other blood cells, or that
5 recruits hematopoietic cells to sites of injury. In addition, this gene product may have
commercial utility in the expansion of stem cells and committed progenitors of
15 various blood lineages, and in the differentiation and/or proliferation of various cell
types. Furthermore, the protein may also be used to determine biological activity,
raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify
20 agents that modulate their interactions, in addition to its use as a nutritional
supplement. Protein, as well as, antibodies directed against the protein may show
utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
25 available and accessible through sequence databases. Some of these sequences are
15 related to SEQ ID NO:20 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
30 cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
20 formula of a-b, where a is any integer between 1 to 2084 of SEQ ID NO:20, b is an
integer of 15 to 2098, where both a and b correspond to the positions of nucleotide
35 residues shown in SEQ ID NO:20, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 11

40 25 The translation product of this gene shares homology with collagen and
collagen like proteins (See, e.g., Genbank Accession Nos.
gil2920535|gb|AAC39658.11 (AF018081) and gil2384942|gb|AAB69961.11
45 (AF022985); all references available through these accession numbers are hereby
incorporated by reference herein). Additionally, it has been determined that this gene
30 has homology to the human Kruppel related zinc finger protein (HTF10) which is
known to be important as a transcription factor, particularly in development (See
50 Genebank Accession No.L11672).

5 In a specific embodiment, polypeptides comprising the amino acid sequence
of the open reading frame upstream of the predicted signal peptide are contemplated
10 by the present invention. Specifically, polypeptides of the invention comprise the
following amino acid sequence: AFAHLQLGPMWKLWRAEEGAAALGGALFLLL
5 FALGVRQLLKQRRPMGFPPGPPGLPFIGNIYSLAASSELPHVYMRKQSQVYG
EVQPRRAPGREGRQAGPGWPGPSWLDLWPPLGRLVGTSPCAGCPLRDTRFPG
15 LEGRS PRRRAPLQGEPRPCR (SEQ ID NO: 275). Polynucleotides encoding these
polypeptides are also provided.

This gene is expressed primarily in human erythroleukemia cell line (HEL),
10 serum induced smooth muscle, and to a lesser extent in human 8 week whole embryo.

Therefore, polynucleotides and polypeptides of the invention are useful as
20 reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
25 not limited to, leukemia, musculoskeletal, or developmental disorders. Similarly,
15 polypeptides and antibodies directed to these polypeptides are useful in providing
immunological probes for differential identification of the tissue(s) or cell type(s). For
a number of disorders of the above tissues or cells, particularly of the hematopoietic
30 system and muscular system, expression of this gene at significantly higher or lower
levels is routinely detected in certain tissues or cell types (e.g., immune,
20 musculoskeletal, or cancerous and wounded tissues) or bodily fluids (e.g., lymph,
35 amniotic fluid, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue
or cell sample taken from an individual having such a disorder, relative to the
standard gene expression level, i.e., the expression level in healthy tissue or bodily
fluid from an individual not having the disorder.

25 Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 134 as residues: Leu-30 to Gly-38, Arg-67 to Val-72,
Val-76 to Ala-89, Pro-118 to Arg-123, Gly-129 to Ala-136, Leu-138 to Arg-146.
45 Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in human erythroleukemia cell line (HEL), and serum
30 induced smooth muscle, and the shared homology with collagen and collagen like
proteins indicates that polynucleotides and polypeptides corresponding to this gene
50 are useful for disorders of hematopoietic or muscular systems, such as leukemia and

5 muscular dystrophy. Additionally, the shared homology with collagen proteins would
10 suggest that this protein may also be important in the diagnosis or treatment of
various autoimmune disorders (i.e., rheumatoid arthritis, lupus, scleroderma,
dermatomyositis, etc.), dwarfism, spinal deformation, joint abnormalities, and
5 chondrodysplasias (i.e. spondyloepiphyseal dysplasia congenita, familial
osteoarthritis, Atelosteogenesis type II, metaphyseal chondrodysplasia type Schmid,
15 etc.).

The secreted protein can also be used to determine biological activity, to raise
antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents
20 that modulate their interactions and as nutritional supplements. It may also have a
very wide range of biological activities although no evidence for any is provided in
the specification. Typical of these are cytokine, cell proliferation/differentiation
modulating activity or induction of other cytokines;

25 immunostimulating/immunosuppressant activities (e.g., for treating human
15 immunodeficiency virus infection, cancer, autoimmune diseases and allergy);
regulation of haematopoiesis (e.g., for treating anaemia or as adjunct to
chemotherapy); stimulation of growth of bone, cartilage, tendons, ligaments and/or
30 nerves (e.g., for treating wounds, stimulation of follicle stimulating hormone (for
control of fertility); chemotactic and chemokinetic activities (e.g., for treating
20 infections, tumours); haemostatic or thrombolytic activity (e.g., for treating
haemophilia, cardiac infarction etc.); anti-inflammatory activity (e.g., for treating
35 septic shock, Crohn's Disease); as antimicrobials; for treating psoriasis or other
hyperproliferative disease; for regulation of metabolism, behaviour, and many others.

Also contemplated is the use of the corresponding nucleic acid in gene therapy
40 25 procedures. Furthermore, the protein may also be used to determine biological
activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors,
to identify agents that modulate their interactions, in addition to its use as a nutritional
45 supplement. Protein, as well as, antibodies directed against the protein may show
utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

30 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
50 related to SEQ ID NO:21 and may have been publicly available prior to conception of

the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1732 of SEQ ID NO:21, b is an integer of 15 to 1746, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:21, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 12

A preferred polypeptide fragment of the invention comprises the following amino acid sequence: MRVRIGLTLLLCVLLSLASASSDEEGSQD
ESLGFQDYFDIR (SEQ ID NO: 276). Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 8. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 8.

This gene is expressed primarily in dendritic cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 135 as residues: Ser-22 to Ser-41, Glu-43 to Thr-50,

Ser-63 to Leu-68, Ser-71 to Gly-84, Ser-96 to Gly-114. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in dendritic cells indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis, prevention, and/or treatment of a variety of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g., by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also used as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, scleroderma and tissues. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. In addition, this gene product may have commercial utility in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types.

The secreted protein can be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions and as nutritional supplements. It may also have a very wide range of biological activities although no evidence for any is provided in the specification. Typical of these are cytokine, cell proliferation/differentiation

modulating activity or induction of other cytokines;
immunostimulating/immunosuppressant activities (e.g., for treating human
immunodeficiency virus infection, cancer, autoimmune diseases and allergy);
regulation of haematopoiesis (e.g., for treating anaemia or as adjunct to
chemotherapy); stimulation of growth of bone, cartilage, tendons, ligaments and/or
nerves (e.g., for treating wounds, stimulation of follicle stimulating hormone (for
control of fertility); chemotactic and chemokinetic activities (e.g., for treating
infections, tumours); haemostatic or thrombolytic activity (e.g., for treating
haemophilia, cardiac infarction etc.); anti-inflammatory activity (e.g., for treating
septic shock, Crohn's Disease); as antimicrobials; for treating psoriasis or other
hyperproliferative disease; for regulation of metabolism, behaviour, and many others.
Also contemplated is the use of the corresponding nucleic acid in gene therapy
procedures. Furthermore, the protein may also be used to determine biological
activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to
identify agents that modulate their interactions, in addition to its use as a nutritional
supplement. Protein, as well as, antibodies directed against the protein may show
utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:22 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
formula of a-b, where a is any integer between 1 to 2862 of SEQ ID NO:22, b is an
integer of 15 to 2876, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:22, and where b is greater than or equal to a + 14.

TMPQE REVHHPHRGDRRRGLPSCGADPVTMCPLPAGARPLIIHSSILEPVSAS
QTRREPSSSNHK GGGGR (SEQ ID NO: 277). Polynucleotides encoding these
polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome
16. Accordingly, polynucleotides related to this invention are useful as a marker in
linkage analysis for chromosome 16.

This gene is expressed primarily in tumor growth factor or lipopolysaccharide
treated bone marrow stroma, epithelioid sarcoma, umbilical vein endothelial cells, and
to a lesser extent, in other tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, hematopoiesis or immune disorders. Similarly, polypeptides and
antibodies directed to these polypeptides are useful in providing immunological
probes for differential identification of the tissue(s) or cell type(s). For a number of
disorders of the above tissues or cells, particularly of the hematopoietic,
integumentary, or immune systems expression of this gene at significantly higher or
lower levels is routinely detected in certain tissues or cell types (e.g., hematopoietic,
immune, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum,
plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken
from an individual having such a disorder, relative to the standard gene expression
level, i.e., the expression level in healthy tissue or bodily fluid from an individual not
having the disorder.

Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 136 as residues: Pro-35 to Trp-42, Pro-65 to Asp-72,
Thr-86 to Phe-93, Ile-97 to Glu-103. Polynucleotides encoding said polypeptides are
also provided.

The tissue distribution in tumor growth factor or lipopolysaccharide treated
bone marrow stroma, epithelioid sarcoma, and umbilical vein endothelial cells
indicates that polynucleotides and polypeptides corresponding to this gene are useful
for the diagnosis, prevention, and/or treatment of a variety of immune system
disorders. Representative uses are described in the "Immune Activity" and "infectious

disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g., by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also used as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, scleroderma and tissues. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. In addition, this gene product may have commercial utility in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types.

The secreted protein can be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions and as nutritional supplements. It may also have a very wide range of biological activities although no evidence for any is provided in the specification. Typical of these are cytokine, cell proliferation/differentiation modulating activity or induction of other cytokines; immunostimulating/immunosuppressant activities (e.g., for treating human immunodeficiency virus infection, cancer, autoimmune diseases and allergy); regulation of haematopoiesis (e.g., for treating anaemia or as adjunct to chemotherapy); stimulation of growth of bone, cartilage, tendons, ligaments and/or nerves (e.g., for treating wounds, stimulation of follicle stimulating hormone (for

control of fertility); chemotactic and chemokinetic activities (e.g., for treating infections, tumours); haemostatic or thrombolytic activity (e.g., for treating haemophilia, cardiac infarction etc.); anti-inflammatory activity (e.g., for treating septic shock, Crohn's Disease); as antimicrobials; for treating psoriasis or other hyperproliferative disease; for regulation of metabolism, behaviour, and many others. Also contemplated is the use of the corresponding nucleic acid in gene therapy procedures. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:23 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1038 of SEQ ID NO:23, b is an integer of 15 to 1052, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:23, and where b is greater than or equal to a + 14.

20 FEATURES OF PROTEIN ENCODED BY GENE NO: 14

The translation product of this gene shares sequence homology with chromaffin granule amine transporter protein which is thought to be important in vesicle membrane amine transport, particularly in the neural and endocrine tissue, and the human vesicular monoamine transporter hVMAT1 which is involved in the regulation of amine storage in cardiovascular, endocrine, and central nervous system function (See, Genbank Accession Nos. gil1314290 and gblAAC50472.11; all references available through these accession numbers are hereby incorporated by reference herein). Based on these sequence similarities, The translation product of this gene is expected to share at least some biological activities with amine transporter proteins. Such activities are known in the art, some of which are described in Erickson, et al., PNAS 93:5166-5171 (1996), and/or Liu, et al., Cell 70:539-551 (1992), which are both incorporated herein by reference.

5 In a specific embodiment, polypeptides comprising the amino acid sequence
of the open reading frame upstream of the predicted signal peptide are contemplated
10 by the present invention. Specifically, polypeptides of the invention comprise the
following amino acid sequence: GTSFLDPTLSLVLEKFNLPAGYVGLVFLGMAL
5 SYAISSPLFGLLSDKRPPLRKWLLVFGNLITAGCYMLLGPVPILHIKSQLWLL
VLLLVVSGLSAGMSIIPTFEILSCAHENGFEGLSTLGLVSGLFSAMWSIGAF
15 MGPTLGGFLYEKIGFEWAAAIQGLWALISGLAMGLFYLLYSRRKRKSKQNIL
STEEERTTLLPNET (SEQ ID NO: 278). Polynucleotides encoding these
polypeptides are also provided.

20 10 The gene encoding the disclosed cDNA is believed to reside on chromosome
6. Accordingly, polynucleotides related to this invention are useful as a marker in
linkage analysis for chromosome 6.

25 This gene is expressed primarily in colon cancer, osteoclastoma, and T-cell
lymphoma, and to a lesser extent in many tumor or proliferative tissues such as
15 endometrial tumor, chondrosarcoma, induced umbilical vein endothelial cells.

Therefore, polynucleotides and polypeptides of the invention are useful as
30 reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, diseases resulting from disorders in small molecule transport (i.e.,
20 signalling molecules) in afflicted tissues and organs, particularly of the endocrine and
central nervous systems. Similarly, polypeptides and antibodies directed to these
35 polypeptides are useful in providing immunological probes for differential
identification of the tissue(s) or cell type(s). For a number of disorders of the above
tissues or cells, particularly of the musculoskeletal, immune, and/or digestive systems
40 25 and cancer expression of this gene at significantly higher or lower levels is routinely
detected in certain tissues or cell types (e.g., neural, endocrine, or cancerous and
wounded tissues) or bodily fluids (e.g., bile, lymph, serum, plasma, urine, synovial
fluid and spinal fluid) or another tissue or cell sample taken from an individual having
45 such a disorder, relative to the standard gene expression level, i.e., the expression
30 level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 137 as residues: Ser-114 to Asn-123, Thr-127 to Thr-132. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in colon cancer, osteoclastoma, and T-cell lymphoma and homology to amine transporter family members indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of disorders or diseases resulted from small molecule transport in afflicted tissues and organs, particularly that of colon, osteoclast or T-cells. The expression in cancer tissues, and shared homology with transporter proteins may also indicate its role in anti-cancer drug resistance. Additionally, the protein can be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands, to identify agents that modulate their interactions and as nutritional supplements. It may also have a very wide range of biological activities although no evidence for any is provided in the specification. Typical of these are cytokine, cell proliferation/differentiation modulating activity or induction of other cytokines; immunostimulating/immunosuppressant activities (e.g. for treating human immunodeficiency virus infection, cancer, autoimmune diseases and allergy); regulation of haematopoiesis (e.g. for treating anaemia or as adjunct to chemotherapy); stimulation of growth of bone, cartilage, tendons, ligaments and/or nerves (e.g. for treating wounds, stimulation of follicle stimulating hormone (for control of fertility); chemotactic and chemokinetic activities (e.g. for treating infections, tumours); haemostatic or thrombolytic activity (e.g. for treating haemophilia, cardiac infarction etc.); anti-inflammatory activity (e.g. for treating septic shock, Crohn's Disease); as antimicrobials; for treating psoriasis or other hyperproliferative disease; or for identifying inhibitors or promoters of the transport of toxic molecules to vesicles, for regulation of metabolism, behaviour, and many others. Also contemplated is the use of the corresponding nucleic acid in gene therapy procedures. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:24 and may have been publicly available prior to conception of

the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1527 of SEQ ID NO:24, b is an integer of 15 to 1541, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:24, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 15

The translation product of this gene shares sequence homology with the human prolyl 4-hydroxylase alpha (II) subunit which is important in catalyzing the formation of 4-hydroxyproline in collagens which is essential for the folding of newly synthesised collagen polypeptide chains into triple-helical molecules (See Genbank Accession No. g01AAB71339.11; all references available through this accession are hereby incorporated herein by reference). Based on the sequence similarity, the translation product of this gene is expected to share at least some biological activities with Prolyl 4-hydroxylase proteins. Such activities are known in the art, some of which are described in Annunen, et al., J. Biol. Chem. 272:17342-17348 (1997) which is incorporated herein by reference.

When tested against U937 myeloid and Jurkat T-cell cell lines, supernatants removed from cells containing this gene activated the gamma activating sequence (GAS), a promoter element found upstream of many genes which are involved in the Jak-STAT pathway. The Jak-STAT pathway is a large, signal transduction pathway involved in the differentiation and proliferation of cells. Therefore, activation of the Jak-STAT pathway, reflected by the binding of the GAS element, can be used to indicate proteins involved in the proliferation and differentiation of cells. Thus, it is likely that this gene activates myeloid cells and T-cells through the Jak-STAT signal transduction pathway.

In a specific embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence:

5 GTREARLRDLTRFYDKVLSLHEDSTTPVANPLLAFTLIKRLQSDWRNVVHSL
EASENIRALKDGYEKVEQDLPAFEDLEGAARALMRLQDVYMLNVKGLAR
10 GVFQRTGSAITDLYSPKRLFSLTGDDCFQVGKVAYDMGDY YHAIPWLEEA

15 KIRELAEPWLQRSVVASGEKQLQVEYRISKSAWLKDTVDLKLVTLNHRIAA
LTGLDVRPPYAEVLQVVNYGIGGHYEPHFDHATSPSSPLYRMKSGNRVATFM
IYLSSEAGGATAFIYANLSVPVVRNAALFWWNLHRSGEGSDTLHAGCP
10 VLVGDKWVANKWHEHYGQEFRRPCSSSPED (SEQ ID NO: 282). Additional,

Preferred polypeptides comprise the following amino acid sequence: GTREA
RLRDLTRFYDKVLSLHEDSTTPVANPLLAFTLIKRLQSDWRNVVHSL EASENI
25 RALKDGYEKVEQ DLPAFEDLEGAARAL (SEQ ID NO: 279), ALMRLQD (SEQ
ID NO: 280), and/or VEAGGAT (SEQ ID NO: 281). Polynucleotides
15 encoding these polypeptides are also provided.

This gene is expressed primarily in lymph node breast cancer, colon
carcinoma, and to a lesser extent in osteoblasts and adipocytes.

30 Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
20 biological sample and for diagnosis of diseases and conditions which include, but are
35 not limited to, disorders of connective and immune tissues, particularly autoimmune
disorders. Similarly, polypeptides and antibodies directed to these polypeptides are
useful in providing immunological probes for differential identification of the
40 tissue(s) or cell type(s). For a number of disorders of the above tissues or cells,
25 particularly of the connective tissues in breast, colon, bone, and fat, expression of this
gene at significantly higher or lower levels is routinely detected in certain tissues or
cell types (e.g., immune, connective, or cancerous and wounded tissues) or bodily
45 fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another
tissue or cell sample taken from an individual having such a disorder, relative to the
30 standard gene expression level, i.e., the expression level in healthy tissue or bodily
fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 138 as residues: Ser-74 to Ala-84, Gln-156 to Tyr-161, Tyr-184 to Asn-189, Ser-218 to Ile-223, Pro-299 to Ser-308, His-359 to Thr-368, Tyr-390 to Asp-404. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in lymph node breast cancer and colon carcinoma and homology to prollyl 4-hydroxylase alpha (II) subunit indicates that polynucleotides and polypeptides corresponding to this gene are useful for intervention of connective tissue disorders and diseases (e.g. arthritis, trauma, tendonitis, chondromalacia and inflammation), as well as, in the diagnosis or treatment of various autoimmune disorders such as rheumatoid arthritis, lupus, scleroderma, and dermatomyositis as well as dwarfism, spinal deformation, and specific joint abnormalities as well as chondrodysplasias ie: spondyloepiphyseal dysplasia congenita, familial osteoarthritis, Atelosteogenesis type II, metaphyseal chondrodysplasia type Schmid. Alternatively, the tissue distribution within various tissue carcinomas and tumor tissues, and biological activity reflected by the binding and activation of the GAS promoter element indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of cancer and other proliferative disorders.

Expression in cellular sources marked by proliferating cells indicates that this protein may play a role in the regulation of cellular division. Similarly, embryonic development also involves decisions involving cell differentiation and/or apoptosis in pattern formation. Thus this protein may also be involved in apoptosis or tissue differentiation and could again be useful in cancer therapy. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:25 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2065 of SEQ ID NO:25, b is an

integer of 15 to 2079, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:25, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 16

In an additional embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: IQPSHAALLHCRSTFRKTECLDPW WVRRQLLMAGIGGLQKMKAPHTGVLHLGSVWVFLGPFLGVGYTLTFNPL SGCMSTVRWLNNSNITANRTLSRSVCHVTPLHRSLSPHDGEYLRQMLLNSSSR AGEAGSWG Y (SEQ ID NO: 283). Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 20. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 20.

This gene is expressed primarily in fetal liver, and, to a lesser extent, in a variety of fetal and other tissues and cell types.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, liver disorders and cancers (e.g., hepatoblastoma, hepatitis, liver metabolic diseases and conditions that are attributable to the differentiation of hepatocyte progenitor cells). Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the liver, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., hepatic, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, bile, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

5

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 139 as residues: Ser-67 to Tyr-75. Polynucleotides encoding said polypeptides are also provided.

10

The tissue distribution in fetal liver indicates that polynucleotides and polypeptides corresponding to this gene are useful for detection and treatment of liver disorders and cancers (e.g., hepatoblastoma, jaundice, hepatitis, liver metabolic diseases and conditions that are attributable to the differentiation of hepatocyte progenitor cells). In addition the expression in fetus would suggest a useful role for the protein product in developmental abnormalities, fetal deficiencies, pre-natal disorders and various wound-healing models and/or tissue trauma. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

KVLKSTKLKIFRGKANIISRIMDGQ RMHLNPNQSWFGIPCSRT (SEQ ID NO: 286). Polynucleotides encoding these polypeptides are also provided.

Included in this invention as preferred domains are Laminin-type EGF-like (LE) domain signatures, which were identified using the ProSite analysis tool (Swiss
15 Institute of Bioinformatics). Laminins are the major noncollagenous components of basement membranes that mediate cell adhesion, growth migration, and differentiation. They are composed of distinct but related alpha, beta and gamma chains. The three chains form a cross-shaped molecule that consist of a long arm and three short globular arms. The long arm consists of a coiled coil structure contributed
20 by all three chains and cross-linked by interchain disulfide bonds. Beside different types of globular domains each subunit contains, in its first half, consecutive repeats of about 60 amino acids in length that include eight conserved cysteines. The tertiary structure of this domain is remotely similar in its N-terminal to that of the EGF-like module. It is known as a 'LE' or 'laminin-type EGF-like' domain. The number of
25 copies of the LE domain in the different forms of laminins is highly variable; from 3 up to 22 copies have been found. A schematic representation of the topology of the four disulfide bonds in the LE domain is shown below.

25

'*': position of the pattern

30

20

In mouse laminin gamma-1 chain, the seventh LE domain has been shown to be the only one that binds with a high affinity to nidogen. The binding-sites are located on the surface within the loops C1-C3 and C5-C6. Long consecutive arrays of LE domains in laminins form rod-like elements of limited flexibility, which determine the spacing in the formation of laminin networks of basement membranes. We derived a signature pattern for the LE domain which covers the C-terminal half of the repeat starting with the fourth conserved cysteine. The consensus pattern is as follows: C-x(1,2)-C-x(5)-G-x(2)-C-x(2)-C-x(3,4)-[FYW]-x(3,15)-C [All C's are involved in disulfide bonds]

35

25

40

Preferred polypeptides of the invention comprise the following amino acid sequence: CDDCQHINTEGQYCQRCKPGFYRDLRRPFSAPDACKPC (SEQ ID NO: 287) and/or CPCKPGVAGRRCDRCMVGYWGFGDYGCRPCDCAGSC (SEQ ID NO: 288). Polynucleotides encoding these polypeptides are also provided.

45

30

50

Further preferred are polypeptides comprising the laminin-type EGF-like domains listed above, and at least 5, 10, 15, 20, 25, 30, 50, or 75 additional contiguous amino acid residues of the sequence encoded by this gene. The additional contiguous amino acid residues is N-terminal or C-terminal to the laminin-type EGF-

55

like domain. Alternatively, the additional contiguous amino acid residues is both N-terminal and C-terminal to the laminin-type EGF-like domain, wherein the total N- and C-terminal contiguous amino acid residues equal the specified number. The above preferred polypeptide domain is characteristic of a signature specific to

Laminin proteins. Based on the sequence similarity, the translation product of this gene is expected to share at least some biological activities with Laminin proteins. Such activities are known in the art, some of which are described elsewhere herein.

This gene is expressed primarily in osteoblastic tissues and cell types, including osteoblasts, osteoblastomas and osteoclastomas. Expression is also abundant in vascular-pulmonary tissues such as lung, micro-vasculature, pulmonary, endothelial and smooth muscle cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, cancer and malignancies (particularly of osteoblastic tissues and rhabdomyosarcoma), as well as cardiovascular and respiratory or pulmonary disorders such as asthma, pulmonary edema, pneumonia, atherosclerosis, restenosis, stroke, thrombosis hypertension, inflammation and wound healing. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the cardio-respiratory system, and skeletal system expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., skeletal, osteoblast, cardio-respiratory, vascular, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, pulmonary surfactant, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 140 as residues: Ser-28 to Cys-34, Thr-51 to Thr-58, Tyr-64 to Asn-81, Asp-111 to Lys-116, Asp-145 to Phe-160, Pro-203 to Glu-217. Polynucleotides encoding said polypeptides are also provided.

5 The tissue distribution in osteoblastic tissues and cell types and homology to
laminin indicates that polynucleotides and polypeptides corresponding to this gene are
10 useful for the treatment, prevention and diagnosis of cardiovascular and respiratory or
pulmonary disorders such as asthma, pulmonary edema, pneumonia, atherosclerosis,
5 restenosis, stroke, angina, thrombosis hypertension, inflammation and wound healing.
As a homolog of laminin, this gene product quite possibly has a role in cell adhesion,
15 migration, proliferation, angiogenesis, chondrogenesis, wound healing and
oncogenesis. An EST (Int J Cancer 1996 May 16;66(4):571-577) with an identical
sequence to part of this contig was shown to be differentially expressed in human
20 10 primary myoblasts and embryonal rhabdomyosarcoma and therefore might have an
important role in the determination or maintenance of the normal phenotype, and thus
its loss is possibly involved in the progression of malignancies, particularly of skeletal
muscle. Similarly, the homology to a laminin would suggest a role in the detection
25 and treatment of disorders and conditions afflicting connective tissues (e.g. arthritis,
15 trauma, tendonitis, chondromalacia and inflammation) in the diagnosis or treatment of
various autoimmune disorders such as rheumatoid arthritis, lupus, scleroderma, and
dermatomyositis as well as dwarfism, spinal deformation, and specific joint
30 abnormalities as well as chondrodysplasias i.e. spondyloepiphyseal dysplasia
congenita, familial osteoarthritis, Atelosteogenesis type II, metaphyseal
20 chondrodysplasia type Schmid. Furthermore, the protein may also be used to
determine biological activity, to raise antibodies, as tissue markers, to isolate cognate
35 ligands or receptors, to identify agents that modulate their interactions, in addition to
its use as a nutritional supplement. Protein, as well as, antibodies directed against the
protein may show utility as a tumor marker and/or immunotherapy targets for the
40 25 above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
45 related to SEQ ID NO:27 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
30 excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
50 more polynucleotides comprising a nucleotide sequence described by the general

formula of a-b, where a is any integer between 1 to 3365 of SEQ ID NO:27, b is an integer of 15 to 3379, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:27, and where b is greater than or equal to a + 14.

5 FEATURES OF PROTEIN ENCODED BY GENE NO: 18

The gene encoding the disclosed cDNA is believed to reside on chromosome 10. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 10.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: NISSQYCILKSLEMMISGLKLLVLFLKFAPENY CLSTETLQMPNRHLRLSKATCYLMKCLLPSTYF (SEQ ID NO: 289).

Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in placenta, brain, and to a lesser extent, in a variety of other tissues and cell types.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, reproductive, behavioral, or nervous system disorders, such as: depression, schizophrenia, Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, dementia, paranoia, addictive behavior, epilepsy, transmissible spongiform encephalopathy (TSE), Creutzfeldt-Jakob disease (CJD). Other diseases and conditions related to expression in the placenta might include developmental anomalies and fetal deficiencies, ovarian and endometrial cancers, reproductive dysfunction and pre-natal disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the central nervous and reproductive systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, reproductive, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, amniotic fluid, serum, plasma, urine, synovial

fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 141 as residues: Ala-16 to Leu-22. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in brain indicates that polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions.

Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, expression in placenta would suggest a possible role in the treatment and diagnosis of developmental anomalies and fetal deficiencies, ovarian and endometrial cancers, reproductive dysfunction and pre-natal disorders.

Similarly, expression within embryonic tissue and other cellular sources marked by proliferating cells indicates that this protein may play a role in the regulation of cellular division. Similarly, embryonic development also involves decisions involving cell differentiation and/or apoptosis in pattern formation. Thus, this protein may also be involved in apoptosis or tissue differentiation and could again be useful in cancer therapy. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may

show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:28 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-h, where a is any integer between 1 to 1992 of SEQ ID NO:28, b is an integer of 15 to 2006, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:28, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 19

The translation product of this gene shares sequence homology with the murine transforming protein (See, e.g., Genbank Accession No. gi153529|emb|CAA36859.1); all references available through this accession are hereby incorporated by reference herein).

In a specific embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: PIEGTPAGTGPEFPGRPTRPQRMRSLLISSHPCQHLLLLLLLLFLILAILVDVKWYLVLFICISLMTSDVEHLFMCLLAIRISSWRNVY (SEQ ID NO: 290). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in activated and basal T-cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immunodeficiency, tumor necrosis, infection, lymphomas, auto-immunities, cancer, metastasis, wound healing, inflammation, anemias (leukemia) and other hematopoietic disorders. Similarly, polypeptides and antibodies directed to these

polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in activated T-cells and the homology to a murine transforming protein indicates polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of a variety of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g., by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also used as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, scleroderma and tissues. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. In addition, this gene product may have commercial utility in the expansion of stem cells and committed progenitors of

various blood lineages, and in the differentiation and/or proliferation of various cell types.

The secreted protein can also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions and as nutritional supplements. It may also have a very wide range of biological activities although no evidence for any is provided in the specification. Typical of these are cytokine, cell proliferation/differentiation modulating activity or induction of other cytokines; immunostimulating/immunosuppressant activities (e.g. for treating human immunodeficiency virus infection, cancer, autoimmune diseases and allergy); regulation of haematopoiesis (e.g. for treating anaemia or as adjunct to chemotherapy); stimulation of growth of bone, cartilage, tendons, ligaments and/or nerves (e.g. for treating wounds, stimulation of follicle stimulating hormone (for control of fertility); chemotactic and chemokinetic activities (e.g. for treating infections, tumours); haemostatic or thrombolytic activity (e.g. for treating haemophilia, cardiac infarction etc.); anti-inflammatory activity (e.g. for treating septic shock, Crohn's Disease); as antimicrobials; for treating psoriasis or other hyperproliferative disease; for regulation of metabolism, behaviour, and many others. Also contemplated is the use of the corresponding nucleic acid in gene therapy procedures. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:29 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 3056 of SEQ ID NO:29, b is an

integer of 15 to 3070, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:29, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 20

The translation product of this gene was shown to have homology to the Mus musculus ALG-2 protein, which is known to code for a Ca(2+)-binding protein required for T cell receptor-, Fas-, and glucocorticoid-induced cell death. ALG-2 mediate Ca(2+)-regulated signals along the death pathway and may play a role in the onset of Alzheimer's Disease (See e.g., Genbank Accession No.gil1213520; all references available through this accession are hereby incorporated by reference herein).

Preferred polypeptides comprise the following amino acid sequence: NWVPT CLCPAPCSFHLLSRFKCLFSPQRLTDIFRRYDTDQDGWIQVSYEQYLSMVFS IV (SEQ ID NO: 291), and/or QRLTDIFRRYDTDQDGWIQVSYEQYLSMVFSIV (SEQ ID NO: 292). Polynucleotides encoding these polypeptides are also provided.

When tested against K562 cell lines, supernatants removed from cells containing this gene activated the ISRE (interferon-sensitive responsive element). Thus, it is likely that this gene activates immune or leukemia cells through the Jaks-STAT signal transduction pathway. ISRE is a promoter element found upstream in many genes which are involved in the Jaks-STAT pathway. The Jaks-STAT pathway is a large, signal transduction pathway involved in the differentiation and proliferation of cells. Therefore, activation of the Jaks-STATs pathway, reflected by the binding of the ISRE element, can be used to indicate proteins involved in the proliferation and differentiation of cells.

A preferred polypeptide fragment of the invention comprises the following amino acid sequence: MFYKLTLLCELSVAGVTQAASQRPLQRLPRHICSQR XPPGRCLLKAXLQTTWXXPKPI PRLSPPLXSDPKR (SEQ ID NO: 293).

Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 5. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 5.

5 This gene is expressed primarily in placenta, and to a lesser extent, in a variety of other tissues and cell types.

10 Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a
5 biological sample and for diagnosis of diseases and conditions which include, but are not limited to, developmental anomalies, fetal deficiencies ovarian and endometrial
15 cancers, reproductive dysfunction and pre-natal disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of
20 disorders of the above tissues or cells, particularly of the reproductive system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., reproductive, developmental, or cancerous and
25 wounded tissues) or bodily fluids (e.g., lymph, amniotic fluid, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an
15 individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

30 Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 143 as residues: Arg-24 to Arg-31. Ile-33 to Gly-41.
20 Polynucleotides encoding said polypeptides are also provided.

35 The tissue distribution in placenta indicates that polynucleotides and polypeptides corresponding to this gene are useful for the treatment, prevention and/or diagnosis of developmental anomalies, fetal deficiencies, ovarian and endometrial cancers, reproductive dysfunction and pre-natal disorders. Expression
40 25 within embryonic tissue and other cellular sources marked by proliferating cells combined with the observed ISRE activity, and homology to the apoptosis linked, ALG-2 indicates that this protein may play a role in the regulation of cellular division, and may show utility in the diagnosis, treatment, and/or prevention of developmental
45 diseases and disorders, cancer, and other proliferative conditions. Representative uses
30 are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions
50 involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:30 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2213 of SEQ ID NO:30, b is an integer of 15 to 2227, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:30, and where b is greater than or equal to a + 14.

5

59

FEATURES OF PROTEIN ENCODED BY GENE NO: 21

The translation product of this gene was shown to have homology to the human histo-blood group A transferase (See, e.g., Genbank Accession No. gb|AAD26573.1|AF134413_1 (AF134413); all references available through this accession are hereby incorporated by reference herein) which is known to represent one of the major allogeneic antigens in both erythrocytes and tissues of humans. Its been proposed that the A phenotype is associated with the glycosyltransferase that converts the H substance associated with the O phenotype to A through the addition of alpha1-3-N-acetylgalactosamine or alpha1-3-galactosyl residues to the H antigen Fuc-alpha1-2Gal-beta1-R. Therefore, the primary product of the histo-blood group A is its respective glycosyltransferase. Preferred polypeptides of the invention comprise the following amino acid sequence: TSSPVFSFCSMAVREPDHLQ RVSLPRYNVSASLQWLPCHRIVLQPWHMCAMWELGQVLFHPVAPREGAAPS PVSTLTWPSSCSHSESTMELELQF (SEQ ID NO: 294), LPCHRIV (SEQ ID NO: 296), SLQWLPCHRIVLQPW (SEQ ID NO: 297), and/or MAVREPDHLQRVSLPR (SEQ ID NO: 295). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in 12-week-old human embryo.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, developmental anomalies, fetal deficiencies, pre-natal disorders, hematopoietic disorders, or cancer. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the developing fetus, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., hematopoietic, lymph, developing, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, amniotic fluid, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in 12 week old embryo indicates that polynucleotides and polypeptides corresponding to this gene are useful for the treatment and diagnosis of developmental anomalies, fetal deficiencies, pre-natal disorders and cancer. Similarly, expression within embryonic tissue and other cellular sources marked by proliferating cells indicates that this protein may play a role in the regulation of cellular division. Similarly, embryonic development also involves decisions involving cell differentiation and/or apoptosis in pattern formation. Thus, this protein may also be involved in apoptosis or tissue differentiation and could again be useful in cancer therapy. Alternatively, the tissue distribution and homology to human blood group A and B glycosyltransferase enzymes indicates that polynucleotides and polypeptides corresponding to this gene are useful for the treatment and diagnosis of hematopoietic related disorders such as anemia, pancytopenia, leukopenia, thrombocytopenia or leukemia since stromal cells are important in the production of cells of hematopoietic lineages. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the uses include bone marrow cell ex-vivo culture, bone marrow transplantation, bone marrow reconstitution, radiotherapy or chemotherapy of neoplasia.

35

40

45

The gene product may also be involved in lymphopoiesis, therefore, it can be used in immune disorders such as infection, inflammation, allergy, immunodeficiency etc. In addition, this gene product may have commercial utility in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

50

55

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. 10

15

excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1274 of SEQ ID NO:31, b is an integer of 15 to 1288, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:31, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 22

20

25

30

35

40

45

50

55

The translation product of this gene shares sequence homology with CD97 (EMR1), which is thought to be important in both adhesion and signaling processes early after leukocyte activation (See, e.g., Genbank Accession No. gil784994; all references available through this accession are hereby incorporated by reference herein). EMR1 belongs to a novel family of G-protein receptors that has recently been recognized on the basis of homologous primary amino acid sequences, comprises receptors to hormones of the secretin/vasoactive intestinal peptide/glucagon family, parathyroid hormone and parathyroid hormone-related peptides, growth hormone-releasing factor, corticotropin-releasing factor, and calcitonin. Proteins with seven transmembrane segments (7TM) define a superfamily of receptors (7TM receptors) sharing the same topology: an extracellular N-terminus, three extramembranous loops on either side of the plasma membrane, and a cytoplasmic C-terminal tail. Upon ligand binding, cytoplasmic portions of the activated receptor interact with heterotrimeric G-coupled proteins to induce various second messengers, which subsequently activate various signal transduction pathways depending upon the specific G-coupled protein associated with the receptor. Preferred polypeptides of the invention comprise the following amino acid sequence: CFKRKPKREHCSCP
ITYQSLGDILNASFFSKRKGMEVKLNSYVVSGTIGLKEKISLSEPVFLTFRHN
QPGDKRTKHICVYWEGSEGGRWSTEGCSHVHNSGYTKCKCFHLSSFAVLV

LIQSVELSIWNASFASPGKGQISEFDIVYETKRCNETRENAFLEAGNNTMDINC
ADALKGNLRESTAV ALSLINLLGIF SEQ ID NO: 299. Polynucleotides

encoding these polypeptides are also provided.

Included in this invention as preferred domains are two EGF-like protein domains, which were identified using the ProSite analysis tool (Swiss Institute of Bioinformatics). First, a sequence of about forty amino-acid residues long found in the sequence of epidermal growth factor (EGF) has been shown to be present in a large number of membrane-bound and extracellular, mostly animal proteins. Many of these proteins require calcium for their biological function and a calcium-binding site has been found to be located at the N-terminus of some EGF-like domains. Calcium-binding is crucial for numerous protein-protein interactions. We have used the N-terminal part of the EGF domain as a consensus pattern. It includes the negative N-terminus and the possible hydroxylation site. The consensus pattern is as follows: [DEQN].[DEQN]{2}C.{3,14}C.{3,7}C.[DN].{4}[FY].C [The four C's are involved in disulfide bonds].

Preferred polypeptides of the invention comprise the following amino acid sequence: DINECETGLAKCKYKAYCRNKVGGYIC (SEQ ID NO: 300).

Polynucleotides encoding these polypeptides are also provided. Secondly, post-translational hydroxylation of aspartic acid or asparagine to form erythro-beta-hydroxyaspartic acid or erythro-beta-hydroxyasparagine has been identified in a number of proteins with domains homologous to (EGF). Based on sequence comparisons of the EGF-homology region that contains hydroxylated Asp or Asn, a consensus sequence located in the N-terminal of EGF-like domains has been identified that seems to be required by the hydroxylase(s). The consensus sequence is as follows: C.[DN].{4}[FY].C.C.

Preferred polypeptides of the invention comprise the following amino acid sequence: CRNKVGGYICSC (SEQ ID NO: 301). Polynucleotides encoding these polypeptides are also provided.

Further preferred are polypeptides comprising the calcium-binding EGF-like domain and aspartic acid and asparagine hydroxylation site listed above, and at least

5, 10, 15, 20, 25, 30, 50, or 75 additional contiguous amino acid residues of the sequence referenced in Table I for this gene and the embodiments listed herein. The additional contiguous amino acid residues is N-terminal or C-terminal to one or both of the listed domains. Alternatively, the additional contiguous amino acid residues is both N-terminal and C-terminal to one or both of the listed domains, wherein the total N- and C-terminal contiguous amino acid residues equal the specified number. The above preferred polypeptide domains are characteristic of a signature specific to EGF like proteins. Based on the sequence similarity and conserved domains, The translation product of this gene is expected to share at least some biological activities with EGF-like proteins. Such activities are known in the art, some of which are described elsewhere herein.

This gene is expressed primarily in eosinophils.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, hematopoietic disorders or anemias and leukemias, immunodeficiencies, infection, lymphomas, auto-immunities and cancer. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune and hematopoietic systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, hematopoietic, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 145 as residues: Ser-22 to Ser-30, Pro-33 to Cys-48, Asp-50 to Lys-67, Pro-117 to Ser-130. Polynucleotides encoding said polypeptides are also provided.

5 The tissue distribution in eosinophils combined with its homology to a known
human seven transmembrane domain protein indicates that polynucleotides and
10 polypeptides corresponding to this gene are useful for the diagnosis and treatment of
cancer and other proliferative disorders, particularly considering the fact that the
5 majority of 7 transmembrane receptors are tightly associated with signal transduction
pathways which are integral to the modulation of the cell cycle. As such, the protein
15 product of this gene may play a role in the regulation of cellular division, where loss
of regulation may result in proliferating cells and the onset of tumors or cancer.
Additionally, the expression in hematopoietic cells and tissues indicates that this
20 protein may play a role in the proliferation, differentiation, and/or survival of
hematopoietic cell lineages. In such an event, this gene is useful in the treatment of
lymphoproliferative disorders, and in the maintenance and differentiation of various
hematopoietic lineages from early hematopoietic stem and committed progenitor
25 cells. Similarly, embryonic development also involves decisions involving cell
differentiation and/or apoptosis in pattern formation. Thus this protein may also be
involved in apoptosis or tissue differentiation and could again be useful in cancer
therapy. Similarly, the tissue distribution and homology to CD97 indicates that the
30 protein product of this gene might be a marker for differentiation and activation of
eosinophils, and therefore is useful for the diagnosis and treatment of immune
20 disorders including: leukemias, lymphomas, auto-immunities, immunodeficiencies
(e.g., AIDS), immuno-suppressive conditions (transplantation) and hematopoietic
35 disorders. Representative uses are described in the "Immune Activity" and "infectious
disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere
herein. In addition this gene product is applicable in conditions of general microbial
40 25 infection, inflammation or cancer. Furthermore, the protein may also be used to
determine biological activity, to raise antibodies, as tissue markers, to isolate cognate
ligands or receptors, to identify agents that modulate their interactions, in addition to
its use as a nutritional supplement. Protein, as well as, antibodies directed against the
45 protein may show utility as a tumor marker and/or immunotherapy targets for the
30 above listed tissues.

50 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are

related to SEQ ID NO:32 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 3266 of SEQ ID NO:32, b is an integer of 15 to 3280, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:32, and where b is greater than or equal to a + 14.

10 FEATURES OF PROTEIN ENCODED BY GENE NO: 23

The translation product of this gene has been found to have homology to the rat neural F box protein NFB42, in addition to a conserved *Caenorhabditis elegans* C14B1.3 protein (See, e.g., Genbank Accession Nos. gi13851648|gb|AAC97505.11 (AF098301) and gi1558270; all references available through these accessions are hereby incorporated by reference herein). Preferred polypeptides of the invention comprise the following amino acid sequence: ALCPPHLLNVTVPAPSCRHVK KVVASPPSTTTMIAMDAPHSKAALDSINELPENILLELFTHVPARQLLLNCRL VCSLWRDLIDLMTLWKRKCLREGFITKDWDQPVADWKIFYFLRSLHRNLLR NPCAEEDMFAWQIDFNGGDRWKVESLPGAHGTDFFDPKVKKYFVTSYEMCL KSQLVDLVAEGYWEELLDTRPDIVVKDWFAARADCGCTYQLKVQLASA DYFVLASFEPPTTIQQWNNATWTEVSYTFSDYPRGVRYLTFQHGGRTQY WAGWYGPRVTNSSIVVSPKMTRNQASSEAQPGQKHGQEEAAQSPYRAVV QIF (SEQ ID NO: 302). Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 1. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 1.

This gene is expressed primarily in immune cells, especially primary dendritic cells, and T cells, and to a lesser extent in a variety of other tissues including breast, keratinocytes, epididymus (cauda), lung, multiple sclerosis, endometrial stromal cells, IL4 induced umbilical vein endothelial cells, fetal kidney, fetal dura mater, rejected kidney, and osteoblasts.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, cancer and other proliferative disorders, particularly of the immune system or endothelial cells. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 146 as residues: Pro-41 to Cys-47, Phe-52 to Gly-59, Pro-62 to His-70. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in immune cells indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of a variety of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product in T-cells indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g., by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also used as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,

5 such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
10 disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic
lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
5 Disease, scleroderma and tissues. Moreover, the protein may represent a secreted
factor that influences the differentiation or behavior of other blood cells, or that
15 recruits hematopoietic cells to sites of injury. In addition, this gene product may have
commercial utility in the expansion of stem cells and committed progenitors of
various blood lineages, and in the differentiation and/or proliferation of various cell
10 types.

The secreted protein can also be used to determine biological activity, to raise
antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents
that modulate their interactions and as nutritional supplements. It may also have a
25 very wide range of biological activities although no evidence for any is provided in
the specification. Typical of these are cytokine, cell proliferation/differentiation
15 modulating activity or induction of other cytokines;
immunostimulating/immunosuppressant activities (e.g., for treating human
30 immunodeficiency virus infection, cancer, autoimmune diseases and allergy);
regulation of haematopoiesis (e.g., for treating anaemia or as adjunct to
20 chemotherapy); stimulation of growth of bone, cartilage, tendons, ligaments and/or
nerves (e.g., for treating wounds, stimulation of follicle stimulating hormone (for
35 control of fertility); chemotactic and chemokinetic activities (e.g. for treating
infections, tumours); haemostatic or thrombolytic activity (e.g., for treating
haemophilia, cardiac infarction etc.); anti-inflammatory activity (e.g., for treating
40 septic shock, Crohn's Disease); as antimicrobials; for treating psoriasis or other
25 hyperproliferative disease; for regulation of metabolism, behaviour, and many others.
Also contemplated is the use of the corresponding nucleic acid in gene therapy
procedures. Protein, as well as, antibodies directed against the protein may show
45 utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

30 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
50 related to SEQ ID NO:33 and may have been publicly available prior to conception of

the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1283 of SEQ ID NO:33, b is an integer of 15 to 1297, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:33, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 24

The translation product of this gene shares sequence homology with the human, mouse, and bovine dopamine hydroxylase which is thought to be important in the modification of dopamine, a neurotransmitter (See Genbank Accession Nos. gil30474, gil162965, and/or gil2358082; all references available through these accessions are hereby incorporated by reference herein). Preferred polypeptides of the invention comprise the following amino acid sequence: RQRSWNPGT
NCYHPNMPDAFLTCETVIFA WAIGGEGFSYPPHVGLSLGTPLDPHYVLELVH
YDNPTYEEGLIDNSGLRFLFYTMDIRKYDAGVIEAGLWVSLFHTIPPGMPEF

DLVNQDVPiPNKDTTYWCQMFKIPVFQEKHHVikVEPVlQRGHESLVHHILL
YQCSNNFNDSVPGIRARIAITPTCPMHSSPV KL (SEQ ID NO: 304).
Polynucleotides encoding these polypeptides are also provided.

5 This gene is expressed primarily in brain, the pulmonary system, and to a lesser extent in kidney.

10 Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a
5 biological sample and for diagnosis of diseases and conditions which include, but are not limited to, neurological and behavioral disorders. Similarly, polypeptides and
15 antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the nervous system, expression
20 of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, endocrine, or cancerous and wounded tissues) or bodily fluids (e.g., sputum, lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder,
25 relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic
30 epitopes shown in SEQ ID NO: 147 as residues: Ser-33 to Trp-38, Gly-40 to Gly-45, Asn-93 to Asp-105, Thr-128 to Thr-137, Glu-150 to Lys-167, Pro-197 to Tyr-203, Cys-242 to Asn-247, Ser-253 to Tyr-258, His-307 to Glu-314, Glu-357 to Gly-362,
20 Trp-373 to Gln-378, Ser-402 to Glu-408. Polynucleotides encoding said polypeptides are also provided.

35 The tissue distribution in brain and homology to a protein involved in the modification of dopamine indicates that polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of
40 neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly,
45 the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome,
30 meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction,
50 aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive

5 compulsive disorder, depression, panic disorder, learning disabilities, ALS,
psychoses, autism, and altered behaviors, including disorders in feeding, sleep
10 patterns, balance, and perception. In addition, the gene or gene product may also play
a role in the treatment and/or detection of developmental disorders associated with the
5 developing embryo, sexually-linked disorders, or disorders of the cardiovascular
system. Alternatively, the homology to dopamine hydroxylase indicates that
15 polynucleotides and polypeptides corresponding to this gene are useful for the
detection, treatment, and/or prevention of various endocrine disorders and cancers,
particularly Addison's Disease, Cushing's Syndrome, and disorders and/or cancers of
20 the pancreas (e.g., diabetes mellitus), adrenal cortex, ovaries, pituitary (e.g., hyper-,
hypopituitarism), thyroid (e.g., hyper-, hypothyroidism), parathyroid (e.g., hyper-,
hypoparathyroidism), hypothalamus, and testes. Furthermore, the protein may also
be used to determine biological activity, to raise antibodies, as tissue markers, to
25 isolate cognate ligands or receptors, to identify agents that modulate their interactions,
15 in addition to its use as a nutritional supplement. Protein, as well as, antibodies
directed against the protein may show utility as a tumor marker and/or
immunotherapy targets for the above listed tissues.

30 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
20 related to SEQ ID NO:34 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
35 excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
40 25 formula of a-b, where a is any integer between 1 to 2170 of SEQ ID NO:34, b is an
integer of 15 to 2184, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:34, and where b is greater than or equal to a + 14.

45 FEATURES OF PROTEIN ENCODED BY GENE NO: 25

30 When tested against Jurkat T-cell lines, supernatants removed from cells
containing this gene activated the gamma activating sequence (GAS), a promoter
50 element found upstream of many genes which are involved in the Jak-STAT pathway.

55

The Jak-STAT pathway is a large, signal transduction pathway involved in the differentiation and proliferation of cells. Therefore, activation of the Jak-STAT pathway, reflected by the binding of the GAS element, can be used to indicate proteins involved in the proliferation and differentiation of cells. Thus, it is likely that this gene activates T-cells through the JakStat signal transduction pathway.

This gene is expressed in a variety of human normal and diseased tissues including breast, infant adrenal gland, skin tumor, colon, pituitary, Wilm's tumor, and to a lesser extent in other tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, breast cancer and other proliferative disorders, afflicting endocrine or endothelial tissues. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the endocrine system or of breast and/or breast lymph nodes, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., reproductive, endocrine, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in breast, infant adrenal gland, skin tumor, colon, pituitary, and Wilm's tumor, and biological activity in activating the GAS promoter element indicates that polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of various endocrine disorders and cancers, particularly Addison's Disease, Cushing's Syndrome, and disorders and/or cancers of the pancreas (e.g., diabetes mellitus), adrenal cortex, ovaries, pituitary (e.g., hyper-, hypopituitarism), thyroid (e.g., hyper-, hypothyroidism), parathyroid (e.g., hyper-, hypoparathyroidism), hypothalamus, and testes. Alternatively, the tissue distribution and biological activity indicates that polynucleotides and polypeptides corresponding to this gene are useful for the

5 diagnosis and treatment of cancer and other proliferative disorders. Expression within
embryonic tissue and other cellular sources marked by proliferating cells, (i.e., breast,
10 skin and Wilm's tumors) indicates that this protein may play a role in the regulation of
cellular division. Additionally, the expression in hematopoietic cells and tissues
5 indicates that this protein may play a role in the proliferation, differentiation, and/or
survival of hematopoietic cell lineages. Representative uses are described in the
15 "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14,
16, 18, 19, 20, and 27, and elsewhere herein. In such an event, this gene is useful in
the treatment of lymphoproliferative disorders, and in the maintenance and
20 differentiation of various hematopoietic lineages from early hematopoietic stem and
committed progenitor cells. Similarly, embryonic development also involves
decisions involving cell differentiation and/or apoptosis in pattern formation. Thus
25 this protein may also be involved in apoptosis or tissue differentiation and could again
be useful in cancer therapy. Furthermore, the protein may also be used to determine
15 biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or
receptors, to identify agents that modulate their interactions, in addition to its use as a
nutritional supplement. Protein, as well as, antibodies directed against the protein may
30 show utility as a tumor marker and/or immunotherapy targets for the above listed
tissues.

20 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
35 related to SEQ ID NO:35 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
40 25 cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
formula of a-b, where a is any integer between 1 to 935 of SEQ ID NO:35, b is an
45 integer of 15 to 949, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:35, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 26

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: TGTFWSPRSQRRGCCGRRAPRPEAMENGAVYS PTTEEDPGPARGPSGLAAYFFMGRLPLLRRVLKGLQLLLSLLAFICEEVVSQ CTLCGGLYFFEFVSCSAFLLSLLILIVYCTPFYERVDTTKVKSSDFYITLTGTCV FLLASIFVSTIIDRTSAEIAIVFGFIASFMLDFTMLYEKRQESQLRKPENTT RAEALTEPLNA (SEQ ID NO: 305). Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 3. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 3.

This gene is expressed primarily in dendritic cells, and to a lesser extent in melanocytes, fetal liver and spleen and several other tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, inflammation, and disorders of the hepatic and immune systems.

Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune and hematopoietic systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., hematopoietic, hepatic, immune, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 149 as residues: Phe-63 to Ser-75, Thr-97 to Ser-102, Glu-128 to Arg-143. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of a variety of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product in dendritic cells indicates a role in the regulation of the proliferation; survival; differentiation; and/or activation of potentially all hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes that may also suggest a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also used as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, scleroderma and tissues. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. In addition, this gene product may have commercial utility in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. Alternatively, the tissue distribution in fetal liver indicates that polynucleotides and polypeptides corresponding to this gene are useful for the detection and treatment of liver disorders and cancers (e.g., hepatoblastoma, jaundice, hepatitis, liver metabolic diseases and conditions that are attributable to the differentiation of hepatocyte progenitor cells). In addition the expression in fetus would suggest a useful role for the protein product in developmental abnormalities, fetal deficiencies, pre-natal disorders and various wound-healing models and/or tissue trauma. Furthermore, the protein may also be used to determine biological activity, raise

antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement.

Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:36 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 3324 of SEQ ID NO:36, b is an integer of 15 to 3338, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:36, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 27

In a specific embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: ASAPRVMRGHLAGFPALSGLASVCLWATFSAQLPGPVAATSWTPAPLGCSAARSQPEKRLGTAAPGSAASLAQAGPGAPCRVLPVDPAPAALNVREPGWLGGLFDGALLQVLLNFLRKSTDVLMDTREAESLEV E (SEQ ID NO: 306).

In another embodiment polypeptides of the invention comprise the following amino acid sequence: NKLHSFPVFLSQQLLDRQLLHAPQTLPTPHCGSSRPGP SHPPWLLIQLPCVHVALWQMLRDFSDSRITPSTLTTPAAQTAAPAKDQES DIVGGEGILCDIAFLQEDHPLGVGGASAPSSRRELSRRGVHTQTLPEDGTLHG TPSSSFDCGIKYIISWPLAPGCDLPSLELSLVCKGVSSCMGFAAG (SEQ ID NO: 307). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in endothelial cells, lung, and fetal kidney, and to a lesser extent in epididymis, keratinocytes and cerebellum.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, cardiovascular diseases involving endothelial cell disturbances such as atherosclerosis. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the cardiovascular system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cardiovascular, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 150 as residues: Arg-47 to Leu-54. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in endothelial cells indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosing and treating disorders of endothelial cells such as atherosclerosis, vasculitis, cardiovascular disease, and emphysema. The secreted protein can also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions and as nutritional supplements. The polypeptide may possess a wide range of undetected biological activities. Typical of these are cytokine, cell proliferation/differentiation modulating activity or induction of other cytokines; immunostimulating/immunosuppressant activities (e.g., for treating human immunodeficiency virus infection, cancer, autoimmune diseases and allergy); regulation of haematopoiesis (e.g., for treating anaemia or as adjunct to chemotherapy); stimulation of growth of bone, cartilage, tendons, ligaments and/or nerves (e.g., for treating wounds, stimulation of follicle stimulating hormone (for control of fertility); chemotactic and chemokinetic activities (e.g., for treating infections, tumours); haemostatic or

5 thrombolytic activity (e.g., for treating haemophilia, cardiac infarction etc.); anti-
inflammatory activity (e.g., for treating septic shock, Crohn's Disease); as
10 antimicrobials; for treating psoriasis or other hyperproliferative disease; for regulation
of metabolism, behaviour, and many others. Also contemplated is the use of the
5 corresponding nucleic acid in gene therapy procedures. Protein, as well as, antibodies
directed against the protein may show utility as a tumor marker and/or
15 immunotherapy targets for the above listed tissues

Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
20 related to SEQ ID NO:37 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
25 more polynucleotides comprising a nucleotide sequence described by the general
15 formula of a-b, where a is any integer between 1 to 1549 of SEQ ID NO:37, b is an
integer of 15 to 1563, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:37, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 28

20 In another embodiment, polypeptides comprising the amino acid sequence of
the open reading frame upstream of the predicted signal peptide are contemplated by
35 the present invention. Specifically, polypeptides of the invention comprise the
following amino acid sequence: PGRPTRPTKNKVCVCLGMLFWAYPICVFIDSL
SCQPCLWSTGATSHFNSPTTSPLFTLFMPCALAPNPFT QLGLDDDR (SEQ ID
40 NO: 308). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in meningima.

Therefore, polynucleotides and polypeptides of the invention are useful as
45 reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
30 not limited to, tumors or disorders of the central nervous system. Similarly,
polypeptides and antibodies directed to these polypeptides are useful in providing
50 immunological probes for differential identification of the tissue(s) or cell type(s). For

5 a number of disorders of the above tissues or cells, particularly of the central nervous
system, expression of this gene at significantly higher or lower levels is routinely
10 detected in certain tissues or cell types (e.g., neural, or cancerous and wounded
tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal
5 fluid) or another tissue or cell sample taken from an individual having such a disorder,
relative to the standard gene expression level, i.e., the expression level in healthy
15 tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 151 as residues: His-29 to Thr-34. Polynucleotides
20 encoding said polypeptides are also provided.

The tissue distribution in meningioma indicates polynucleotides and
polypeptides corresponding to this gene are useful for the detection, treatment, and/or
prevention of neurodegenerative disease states, behavioral disorders, or inflammatory
25 conditions. Representative uses are described in the "Regeneration" and
15 "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and
elsewhere herein. Briefly, the uses include, but are not limited to the detection,
treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease,
30 Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating
diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal
20 cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia,
mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder,
35 learning disabilities, ALS, psychoses, autism, and altered behaviors, including
disorders in feeding, sleep patterns, balance, and perception, as well as disorders of
the meninges such as meningioma and meningitis. In addition, the gene or gene
40 25 product may also play a role in the treatment and/or detection of developmental
disorders associated with the developing embryo, sexually-linked disorders, or
disorders of the cardiovascular system. Furthermore, the protein may also be used to
determine biological activity, to raise antibodies, as tissue markers, to isolate cognate
45 ligands or receptors, to identify agents that modulate their interactions, in addition to
30 its use as a nutritional supplement. Protein, as well as, antibodies directed against the
protein may show utility as a tumor marker and/or immunotherapy targets for the
50 above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:38 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1034 of SEQ ID NO:38, b is an integer of 15 to 1048, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:38, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 29

The translation product of this gene has been shown to encode a human brain specific mitochondrial carrier (Genbank Accession No. gi13851540|gb|AAD04346.1| (AF078544); all references available through this accession are hereby incorporated herein by reference) which shares sequence homology with the human body weight disorder associated gene C5 product which is known to be differentially expressed in obese compared to lean mice (See GeneSeq Accession No. R91281). Based on the sequence similarity, the translation product of this gene is expected to share at least some biological activities with mitochondrial carriers proteins. Such activities are known in the art, some of which are described in Sanchis et al, J. Biol. Chem. 273:34611-34615 (1998), incorporated herein by reference.

Included in this invention as preferred domains are mitochondrial energy transfer protein (METP) domains, which were identified using the ProSite analysis tool (Swiss Institute of Bioinformatics). Structurally, members of the family of mitochondrial energy transfer proteins consist of three tandem repeats of a domain of approximately one hundred residues. Each of these domains contains two transmembrane regions. As a signature pattern, we selected one of the most conserved regions in the repeated domain, located just after the first transmembrane region. To detect this widespread family of proteins, a consensus sequence was developed that contains the most conserved regions in the repeated domain. The consensus pattern is as follows: P.[DE].[LIVAT][RK].[LRH][LIVMFY][QMAIGV].

Preferred polypeptides of the invention comprise the following amino acid sequences: PVDLTKTRLQ (SEQ ID NO: 309) and PTDVLKIRMQ (SEQ ID NO: 310). Polynucleotides encoding these polypeptides are also provided.

Further preferred are polypeptides comprising the METP domains of the sequence listed above, and at least 5, 10, 15, 20, 25, 30, 50, or 75 additional contiguous amino acid residues of the sequence referenced in Table I for this gene. The additional contiguous amino acid residues is N-terminal or C-terminal to the METP domain. Alternatively, the additional contiguous amino acid residues is both N-terminal and C-terminal to the METP domain, wherein the total N- and C-terminal contiguous amino acid residues equal the specified number. The above preferred polypeptide domain is characteristic of a signature specific to mitochondrial energy transfer proteins.

The gene encoding the disclosed cDNA is believed to reside on chromosome X. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome X.

This gene is expressed primarily in brain, and to a lesser extent, in T-cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, neurological and behavioral disorders and immune disorders and/or obesity. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the digestive, immune, and nervous systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, neural, or cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 152 as residues: Gln-189 to Gly-195. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in brain and homology to mitochondrial carrier proteins indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:39 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general

formula of a-b, where a is any integer between 1 to 1416 of SEQ ID NO:39, b is an integer of 15 to 1430, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:39, and where b is greater than or equal to a + 14.

5 FEATURES OF PROTEIN ENCODED BY GENE NO: 30

Preferred polypeptides of the invention comprise the following amino acid sequence: MTFGSTISPTSTHASPGLGCCSWLLEDLEEQLYCSAFE~~E~~AALTR
RICNPTSCWLPLDMELLHRQVLA~~L~~QTQRVLLGMWLRRAWDTWVSPRRVAP
GSRCLLTASHPCTEKRRKASAXQRNLGYPLAMLCLLVLTGLSVLVIAIHLEL
LIDEAAMP~~R~~GMQGTSLGQVSFSKLGSGFAGVIQVVLIFYLMVSSVVGFYSSPLF
RSLRPRWHD~~T~~AMTQIIGNCVCLLVSSALPVFSR~~T~~LGLTRFDLLGDFGRFNWL
GNFYIVFLYNAAFAGLT~~T~~LCLVKTF~~T~~AAVRAELIRAFGLDRLPLPVSGFPQAS
RKTQHQ (SEQ ID NO: 311). Polynucleotides encoding such polypeptides are also provided.

This gene is expressed primarily in immune system tissues (e.g. resting T-cells, primary dendritic cells, and neutrophils, apoptotic T-cells) and umbilical vein. This gene is expressed to a lesser extent in the gastrointestinal tissue (e.g. small intestine, colon), brain (e.g. cerebellum, frontal cortex), aorta endothelial cells, skin tumor, embryonic tissue, thymus, and cancers (e.g. cheek, breast, synovial).

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, cancer and immune disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system and gastrointestinal tract expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, gastrointestinal, cancerous and wounded tissues) or bodily fluids (e.g., amniotic, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 153 as residues: Asp-21 to Ser-29. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in immune cells (e.g. T-cells, dendritic cells, neutrophils) indicates polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of a variety of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. The tissue distribution in skin tumors and cancerous tissue (e.g. cheek, breast, synovial sarcoma) indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of cancer and other proliferative disorders. Expression in cellular sources such as embryonic tissue marked by proliferating cells indicates that this protein may play a role in the regulation of cellular division. Additionally, the

5 expression in hematopoietic cells and tissues indicates that this protein may play a
role in the proliferation, differentiation, and/or survival of hematopoietic cell lineages.
10 In such an event, this gene is useful in the treatment of lymphoproliferative disorders,
and in the maintenance and differentiation of various hematopoietic lineages from
5 early hematopoietic stem and committed progenitor cells. Similarly, embryonic
development also involves decisions involving cell differentiation and/or apoptosis in
15 pattern formation. Thus this protein may also be involved in apoptosis or tissue
differentiation and could again be useful in cancer therapy. Protein, as well as,
antibodies directed against the protein may show utility as a tumor marker and/or
20 immunotherapy targets for the above listed tissues. The tissue distribution in
cerebellum and frontal cortex indicates polynucleotides and polypeptides
corresponding to this gene are useful for the detection, treatment, and/or prevention of
neurodegenerative disease states, behavioral disorders, or inflammatory conditions.
25 Representative uses are described in the "Regeneration" and "Hyperproliferative
Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly,
the uses include, but are not limited to the detection, treatment, and/or prevention of
30 Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome,
meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia,
trauma, congenital malformations, spinal cord injuries, ischemia and infarction,
20 aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive
compulsive disorder, depression, panic disorder, learning disabilities, ALS,
35 psychoses, autism, and altered behaviors, including disorders in feeding, sleep
patterns, balance, and perception. In addition, elevated expression of this gene product
in regions of the brain indicates it plays a role in normal neural function.
40 25 Potentially, this gene product is involved in synapse formation,
neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or
survival. Furthermore, the protein may also be used to determine biological activity,
45 to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to
identify agents that modulate their interactions, in addition to its use as a nutritional
30 supplement. Protein, as well as, antibodies directed against the protein may show
utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:40 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2089 of SEQ ID NO:40, b is an integer of 15 to 2103, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:40, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 31

The polypeptide of this gene has been determined to have a zinc finger (Zinc finger, C2H2 type) domain at about amino acid position 16-50 of the amino acid sequence referenced in Table 1 for this gene. Therefore,

A preferred polypeptide fragment of the invention comprises the following amino acid sequence: LCVCLVYLCMYGVCLCVIVCVSGVSLCLYVWGVSVCDVSVFMCVCLCVIFCVYVGKPRTEHYHSPHLAKQKAFREMCGRHDVSAAGIFQSYV (SEQ ID NO: 312). Polynucleotides encoding these polypeptides are also provided. 'Zinc finger' domains are nucleic acid-binding protein structures first identified in the *Xenopus* transcription factor TFIIIA. These domains have since been found in numerous nucleic acid-binding proteins. A zinc finger domain is composed of 25 to 30 amino-acid residues. There are two cysteine or histidine residues at both extremities of the domain, which are involved in the tetrahedral coordination of a zinc atom. It has been proposed that such a domain interacts with about five nucleotides. A schematic representation of a zinc finger domain is shown below:

Many classes of zinc fingers are characterized according to the number and positions of the histidine and cysteine residues involved in the zinc atom coordination. In the first class to be characterized, called C2H2, the first pair of zinc coordinating residues are cysteines, while the second pair are histidines. A number of experimental reports have demonstrated the zinc-dependent DNA- or RNA-binding property of some members of this class. Some of the proteins known to include C2H2-type zinc fingers are listed below. We have indicated, between brackets, the number of zinc finger regions found in each of these proteins; a '+' symbol indicates that only partial sequence data is available and that additional finger domains is present.

This gene is expressed primarily in salivary gland.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, salivary gland related diseases, diseases of the mouth, and other digestive disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the digestive system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., saliva, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 154 as residues: Gly-46 to His-54. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution indicates that the protein products of this gene are useful for diagnosis and treatment of salivary gland related diseases (mumps, calculi formation in ducts, sarcoidosis, facial palsy, tumors, Sjogrens Syndrome) and other digestive system disorders. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:41 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2335 of SEQ ID NO:41, b is an integer of 15 to 2349, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:41, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 32

This gene is expressed primarily in fetal tissue (e.g. spleen, liver, brain), cancerous tissues (e.g. ovarian, colon, stomach, parathyroid) and to a lesser extent in immune cells and tissue (e.g. B-cells, T-cells, bone marrow), and reproductive organs.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, cancer, particularly of the colon and ovaries, disorders of the developing fetus, neurodegenerative conditions, and immune system disorders.

Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, reproductive, neural, cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 155 as residues: Lys-35 to Lys-47. Polynucleotides encoding said polypeptides are also provided.

The expression of this gene within fetal tissue and other cellular sources marked by proliferating cells indicates this protein may play a role in the regulation of cellular division, and may show utility in the diagnosis, treatment, and/or prevention of developmental diseases and disorders, including cancer, and other proliferative conditions. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in

modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. The tissue distribution in immune cells (such as T-cells and B-cells) and immune tissues (bone marrow) indicates polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of a variety of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. The tissue distribution in parathyroid indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of various endocrine disorders and cancers. Representative uses are described in the "Biological Activity", "Hyperproliferative Disorders", and "Binding Activity" sections below, in Example 11, 17, 18, 19, 20 and 27, and elsewhere herein. Briefly, the protein can be used for

the detection, treatment, and/or prevention of Addison's Disease, Cushing's Syndrome, and disorders and/or cancers of the pancreas (e.g. diabetes mellitus), adrenal cortex, ovaries, pituitary (e.g., hyper-, hypopituitarism), thyroid (e.g. hyper-, hypothyroidism), parathyroid (e.g. hyper-, hypoparathyroidism), hypothalamus, and testes. Additionally, the tissue distribution in brain tissue indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:42 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or

more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1545 of SEQ ID NO:42, b is an integer of 15 to 1559, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:42, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 33

When tested against U937 Myeloid cell lines, supernatants removed from cells containing this gene activated the GAS assay. Thus, it is likely that this gene activates myeloid cells through the Jak-STAT signal transduction pathway. The gamma activating sequence (GAS) is a promoter element found upstream of many genes which are involved in the Jak-STAT pathway. The Jak-STAT pathway is a large, signal transduction pathway involved in the differentiation and proliferation of cells. Therefore, activation of the Jak-STAT pathway, reflected by the binding of the GAS element, can be used to indicate proteins involved in the proliferation and differentiation of cells.

This gene is expressed primarily in skin tumors.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, skin disorders, particularly skin cancer. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the skin, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 156 as residues: Pro-38 to Gly-44, Phe-56 to Thr-64. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in skin indicates that polynucleotides and polypeptides corresponding to this gene are useful for the treatment, diagnosis, and/or prevention of various skin disorders including congenital disorders (i.e. nevi, moles, freckles, Mongolian spots, hemangiomas, port-wine syndrome), integumentary tumors (i.e. keratoses, Bowen's Disease, basal cell carcinoma, squamous cell carcinoma, malignant melanoma, Paget's Disease, mycosis fungoides, and Kaposi's sarcoma), injuries and inflammation of the skin (i.e. wounds, rashes, prickly heat disorder, psoriasis, dermatitis), atherosclerosis, urticaria, eczema, photosensitivity, autoimmune disorders (i.e. lupus erythematosus, vitiligo, dermatomyositis, morphea, scleroderma, pemphigoid, and pemphigus), keloids, striae, erythema, petechiae, purpura, and xanthelasma. Moreover, such disorders may predispose increased susceptibility to viral and bacterial infections of the skin (i.e. cold sores, warts, chickenpox, molluscum contagiosum, herpes zoster, boils, cellulitis, erysipelas, impetigo, tinea, athlete's foot, and ringworm). Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and immunotherapy targets for the above listed tumors and tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:43 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1752 of SEQ ID NO:43, b is an integer of 15 to 1766, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:43, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 34

The translation product of this gene shares sequence homology with mitogen-induced prostate carcinoma (mouse) which is thought to be important in the etiology of cancer. In this respect, this gene is mitogen-induced and/or involved in cell proliferation.

Preferred polypeptides of the invention comprise the following amino acid sequence: GHMPYGWLTEIRAVYPAFDKNNPSNKLVSTSTVTAAHIKKF
TFVCMALSLTLCFVMFWTPNVSEKILIDIGVDFAFAELCVVPLRIFSFFPVPVT
VRAHLTGWLMTLKKTFVLAPSSVLRIIVLIASLVVLPYLGVHGATLGVGSLLA
GFVGESTMVAIAACYVYRKQKKMENESATEGEDSAMTDMPPTEEVTDIVE
MREENE (SEQ ID NO: 313) and/or QVVFVAILLHSHLECREPLILSLYMGA
LVRCTTLCLGYKNIHDIIIPDRSGPELGGDATIRKMLSFWWPLALILATQRISR
PIVNLFVSRDLGGSSAATEAVAILTATYPV (SEQ ID NO: 314). Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 5. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 5.

This gene is expressed primarily in early infant and adult brain, retina, fetal tissue (e.g., liver, spleen, whole embryo) and to a lesser extent in immune cells (e.g., monocytes and T-cells), colon, and parathyroid tumor tissue.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, cancers, disorders of the immune system and nervous system.

Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the metabolic system (cancers), expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, neural, cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 157 as residues: Arg-122 to Ser-139, Met-144 to Glu-149. Polynucleotides encoding said polypeptides are also provided.

5 The tissue distribution and homology to mitogen induced prostate carcinoma
10 (mouse) indicates that polynucleotides and polypeptides corresponding to this gene
are useful for the study and treatment of cancers, including but not limited to the
colon, parathyroid, and adrenal glands. Moreover, the expression within fetal tissue
5 and other cellular sources marked by proliferating cells indicates this protein may
play a role in the regulation of cellular division, and may show utility in the diagnosis,
15 treatment, and/or prevention of developmental diseases and disorders, including
cancer, and other proliferative conditions. Representative uses are described in the
"Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere
20 herein. Briefly, developmental tissues rely on decisions involving cell differentiation
and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell
25 death, as occurs in the development of some cancers, or in failure to control the extent
of cell death, as is believed to occur in acquired immunodeficiency and certain
15 neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of
potential roles in proliferation and differentiation, this gene product may have
applications in the adult for tissue regeneration and the treatment of cancers. It may
30 also act as a morphogen to control cell and tissue type specification. Therefore, the
polynucleotides and polypeptides of the present invention are useful in treating,
20 detecting, and/or preventing said disorders and conditions, in addition to other types
of degenerative conditions. Thus this protein may modulate apoptosis or tissue
differentiation and is useful in the detection, treatment, and/or prevention of
35 degenerative or proliferative conditions and diseases. The protein is useful in
modulating the immune response to aberrant polypeptides, as may exist in
40 proliferating and cancerous cells and tissues. The protein can also be used to gain new
insight into the regulation of cellular growth and proliferation. The tissue distribution
in immune cells (T-cells, monocytes) indicates polynucleotides and polypeptides
45 corresponding to this gene are useful for the diagnosis and treatment of a variety of
immune system disorders. Representative uses are described in the "Immune
30 Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19,
20, and 27, and elsewhere herein. Briefly, the expression of this gene product
50 indicates a role in regulating the proliferation; survival; differentiation; and/or

5
10
activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. The tissue distribution in brain indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:44 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2558 of SEQ ID NO:44, b is an integer of 15 to 2572, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:44, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 35

This gene is expressed primarily in adult pulmonary tissue, umbilical vein, prostate, and fetal tissue (e.g., heart).

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, diseases of the pulmonary system. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the pulmonary system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., pulmonary, cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the

5 standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

10 Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 158 as residues: Arg-45 to Gly-51, Glu-75 to Asn-81.

5 Polynucleotides encoding said polypeptides are also provided.

15 The tissue distribution in pulmonary tissue indicates that polynucleotides and polypeptides corresponding to this gene are useful for the detection and treatment of disorders associated with developing lungs, particularly in premature infants where the lungs are the last tissues to develop. Additionally, the tissue distribution indicates
20 that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and intervention of lung tumors, since the gene is involved in the regulation of cell division, particularly since it is expressed in fetal tissue. Moreover, the expression within fetal tissue and other cellular sources marked by proliferating cells indicates this protein may play a role in the regulation of cellular division, and may
25 show utility in the diagnosis, treatment, and/or prevention of developmental diseases and disorders, including cancer, and other proliferative conditions. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections
30 below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

20 Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have
40 applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating,
45 detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue
30 differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in
50 modulating the immune response to aberrant polypeptides, as may exist in

proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:45 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-h, where a is any integer between 1 to 512 of SEQ ID NO:45, b is an integer of 15 to 526, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:45, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 36

This gene is expressed primarily in adipose tissue.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, fat metabolism. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the metabolic system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e.,

the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 159 as residues: Pro-96 to Ser-106. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in adipose tissue indicates that polynucleotides and polypeptides corresponding to this gene are useful for the treatment of obesity and other metabolic and endocrine conditions or disorders. Furthermore, the protein product of this gene may show utility in ameliorating conditions which occur secondary to aberrant fatty-acid metabolism (e.g. aberrant myelin sheath development), either directly or indirectly. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:46 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1018 of SEQ ID NO:46, b is an integer of 15 to 1032, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:46, and where b is greater than or equal to a + 14.

25 FEATURES OF PROTEIN ENCODED BY GENE NO: 37

This gene is expressed primarily in adult brain tissue, testes, placenta, kidney, infant and fetal tissue (e.g., liver, spleen, lung) and to a lesser extent in immune cells (e.g., T-cells and neutrophils) and in cancerous tissues (e.g., ovarian tumor, Hodgkins lymphoma, pancreas, T-cell).

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are

5 not limited to, CNS disorders, disorders of the testicles, cancer, particularly ovarian,
pancreatic, T-cell, and Hodgekin's lymphoma. Similarly, polypeptides and antibodies
10 directed to these polypeptides are useful in providing immunological probes for
differential identification of the tissue(s) or cell type(s). For a number of disorders of
5 the above tissues or cells, particularly of the brain, CNS, and testes expression of this
gene at significantly higher or lower levels is routinely detected in certain tissues or
15 cell types (e.g., neural, urogenital, cancerous and wounded tissues) or bodily fluids
(e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell
sample taken from an individual having such a disorder, relative to the standard gene
20 expression level, i.e., the expression level in healthy tissue or bodily fluid from an
individual not having the disorder.

The tissue distribution in brain indicates polynucleotides and polypeptides
corresponding to this gene are useful for the detection, treatment, and/or prevention of
25 neurodegenerative disease states, behavioral disorders, or inflammatory conditions.
15 Representative uses are described in the "Regeneration" and "Hyperproliferative
Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly,
the uses include, but are not limited to the detection, treatment, and/or prevention of
30 Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome,
meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia,
20 trauma, congenital malformations, spinal cord injuries, ischemia and infarction,
aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive
35 compulsive disorder, depression, panic disorder, learning disabilities, ALS,
psychoses, autism, and altered behaviors, including disorders in feeding, sleep
patterns, balance, and perception. In addition, elevated expression of this gene product
40 25 in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation,
neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or
45 survival. Moreover, the expression within fetal tissue and other cellular sources
marked by proliferating cells indicates this protein may play a role in the regulation of
30 cellular division, and may show utility in the diagnosis, treatment, and/or prevention
of developmental diseases and disorders, including cancer, and other proliferative
50 conditions. Representative uses are described in the "Hyperproliferative Disorders"

and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. The tissue distribution indicates polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of a variety of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,

5 such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
10 disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic
lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
5 Disease, and scleroderma. Moreover, the protein may represent a secreted factor that
influences the differentiation or behavior of other blood cells, or that recruits
15 hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in
the expansion of stem cells and committed progenitors of various blood lineages, and
in the differentiation and/or proliferation of various cell types. Additionally, the
20 tissue distribution in testes indicates that polynucleotides and polypeptides
corresponding to this gene are useful for the treatment and diagnosis of conditions
concerning proper testicular function (e.g. endocrine function, sperm maturation), as
well as cancer. Therefore, this gene product is useful in the treatment of male
25 infertility and/or impotence. This gene product is also useful in assays designed to
15 identify binding agents, as such agents (antagonists) are useful as male contraceptive
agents. Similarly, the protein is believed to be useful in the treatment and/or diagnosis
of testicular cancer. The testes are also a site of active gene expression of transcripts
30 that is expressed, particularly at low levels, in other tissues of the body. Therefore,
this gene product is expressed in other specific tissues or organs where it may play
20 related functional roles in other processes, such as hematopoiesis, inflammation, bone
formation, and kidney function, to name a few possible target indications.
35 Furthermore, the protein may also be used to determine biological activity, raise
antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents
that modulate their interactions, in addition to its use as a nutritional supplement.
40 25 Protein, as well as, antibodies directed against the protein may show utility as a tumor
marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
45 available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:47 and may have been publicly available prior to conception of
30 the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
50 cumbersome. Accordingly, preferably excluded from the present invention are one or

more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2666 of SEQ ID NO:47, b is an integer of 15 to 2680, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:47, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 38

When tested against fibroblast cell lines, supernatants removed from cells containing this gene activated the EGR1 assay. Thus, it is likely that this gene activates fibroblast cells through a signal transduction pathway. Early growth response 1 (EGR1) is a promoter associated with certain genes that induces various tissues and cell types upon activation, leading the cells to undergo differentiation and proliferation.

This gene is expressed primarily in endometrial stromal cells, endometrial tumors, keratinocytes, fetal tissue (e.g. liver, spleen) and to a lesser extent in endothelial cells and immune cells (e.g., T-cells).

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, endometrial carcinoma and immune cells disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the female reproductive system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in the endometrium indicates that polynucleotides and polypeptides corresponding to this gene are useful for treating female infertility. The protein product is likely involved in preparation of the endometrium of implantation and could be administered either topically or orally. Alternatively, this gene could be

transfected in gene-replacement treatments into the cells of the endometrium and the protein products could be produced. Similarly, these treatments could be performed during artificial insemination for the purpose of increasing the likelihood of implantation and development of a healthy embryo. In both cases this gene or its gene product could be administered at later stages of pregnancy to promote healthy development of the endometrium. Additionally, polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of endometrial carcinoma. The tissue distribution indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of cancer and other proliferative disorders. Expression within embryonic tissue and other cellular sources marked by proliferating cells indicates that this protein may play a role in the regulation of cellular division. Additionally, the expression in hematopoietic cells and tissues indicates that this protein may play a role in the proliferation, differentiation, and/or survival of hematopoietic cell lineages. In such an event, this gene is useful in the treatment of lymphoproliferative disorders, and in the maintenance and differentiation of various hematopoietic lineages from early hematopoietic stem and committed progenitor cells. Similarly, embryonic development also involves decisions involving cell differentiation and/or apoptosis in pattern formation. Thus this protein may also be involved in apoptosis or tissue differentiation and could again be useful in cancer therapy. The tissue distribution in immune cells such as helper T-cells indicates polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of a variety of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such

as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. The tissue distribution in keratinocytes indicates polynucleotides and polypeptides corresponding to this gene are useful for the treatment, diagnosis, and/or prevention of various skin disorders. Representative uses are described in the "Biological Activity", "Hyperproliferative Disorders", "infectious disease", and "Regeneration" sections below, in Example 11, 19, and 20, and elsewhere herein. Briefly, the protein is useful in detecting, treating, and/or preventing congenital disorders (i.e. nevi, moles, freckles, Mongolian spots, hemangiomas, port-wine syndrome), integumentary tumors (i.e. keratoses, Bowen's Disease, basal cell carcinoma, squamous cell carcinoma, malignant melanoma, Paget's Disease, mycosis fungoides, and Kaposi's sarcoma), injuries and inflammation of the skin (i.e. wounds, rashes, prickly heat disorder, psoriasis, dermatitis), atherosclerosis, urticaria, eczema, photosensitivity, autoimmune disorders (i.e. lupus erythematosus, vitiligo, dermatomyositis, morphea, scleroderma, pemphigoid, and pemphigus), keloids, striae, erythema, petechiae, purpura, and xanthelasma. In addition, such disorders may predispose increased susceptibility to viral and bacterial infections of the skin (i.e. cold sores, warts, chickenpox, molluscum contagiosum, herpes zoster, boils, cellulitis, erysipelas, impetigo, tinea, athlete's foot, and ringworm). Moreover, the protein product of this gene may also be useful for the treatment or diagnosis of various connective tissue disorders (i.e., arthritis, trauma, tendonitis, chondromalacia and inflammation, etc.), autoimmune disorders (i.e., rheumatoid arthritis, lupus, scleroderma, dermatomyositis, etc.), dwarfism, spinal deformation, joint abnormalities, and

5 chondrodysplasias (i.e. spondyloepiphyseal dysplasia congenita, familial
osteoarthritis, Atelosteogenesis type II, metaphyseal chondrodysplasia type Schmid).
10 Furthermore, the protein may also be used to determine biological activity, to raise
antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents
5 that modulate their interactions, in addition to its use as a nutritional supplement.
Protein, as well as, antibodies directed against the protein may show utility as a tumor
15 marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
20 related to SEQ ID NO:48 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
25 more polynucleotides comprising a nucleotide sequence described by the general
15 formula of a-b, where a is any integer between 1 to 1716 of SEQ ID NO:48, b is an
integer of 15 to 1730, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:48, and where b is greater than or equal to a + 14.
30

FEATURES OF PROTEIN ENCODED BY GENE NO: 39

20 This gene is expressed primarily in LNCAP cells (prostate cell line) and retina
derived N2b5HR cells.
35

Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
40 not limited to, prostate cancer and eye disorders. Similarly, polypeptides and
25 antibodies directed to these polypeptides are useful in providing immunological
probes for differential identification of the tissue(s) or cell type(s). For a number of
disorders of the above tissues or cells, particularly of the male urogenital and
45 reproductive system expression of this gene at significantly higher or lower levels is
routinely detected in certain tissues or cell types (e.g., cancerous and wounded
30 tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or
50 another tissue or cell sample taken from an individual having such a disorder, relative

5 to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

10 Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 162 as residues: Asn-50 to Ser-57. Polynucleotides
5 encoding said polypeptides are also provided.

15 The expression in prostate may indicate the gene or its products can be used in the disorders of the prostate, including inflammatory disorders, such as chronic prostatitis, granulomatous prostatitis and malacoplakia, prostatic hyperplasia and prostate neoplastic disorders, including adenocarcinoma, transitional cell carcinomas,
20 ductal carcinomas, squamous cell carcinomas, or as hormones or factors with systemic or reproductive functions. The tissue distribution in retina indicates that polynucleotides and polypeptides corresponding to this gene are useful for the treatment and/or detection of eye disorders including blindness, color blindness,
25 impaired vision, short and long sightedness, retinitis pigmentosa, retinitis proliferans, and retinoblastoma, retinchoroiditis, retinopathy and retinoschisis. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as,
30 antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

35 Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:49 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically
40 25 excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1261 of SEQ ID NO:49, b is an
45 integer of 15 to 1275, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:49, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 40

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: RCCCRGCSCRARLCPPARSTAVAPECRGAHPSR
AMRPGTALQAVLLAVLLVGLRAATGRLLSGQPVCRRGTQRPCYKVIYFHD
TSRRLNFEEAKEACRRGWRPASQHRVLKMNRN (SEQ ID NO: 315).

Polynucleotides encoding these polypeptides are also provided.

A preferred polypeptide fragment of the invention comprises the following amino acid sequence: MRPGTALQAVLLAVLLVGLRAATGRLLSGQPVCRRG
TQRPCYKVIYFHDTSRRLNFEEAKEACRRGWRPASQHRVLKMNRN (SEQ ID
NO: 316). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in smooth muscle and human thyroid and to a lesser extent in amniotic cells and human endometrial stromal cells-treated with progesterone.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, thyroid disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the endocrine system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 163 as residues: Ser-75 to Leu-81. Polynucleotides encoding said polypeptides are also provided.

5 The tissue distribution indicates that polynucleotides and polypeptides
corresponding to this gene are useful for diagnosis and treatment of endocrine
10 disorders of the thyroid.

Many polynucleotide sequences, such as EST sequences, are publicly
5 available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:50 and may have been publicly available prior to conception of
15 the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
20 more polynucleotides comprising a nucleotide sequence described by the general
formula of a-b, where a is any integer between 1 to 1748 of SEQ ID NO:50, b is an
integer of 15 to 1762, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:50, and where b is greater than or equal to a + 14.

15 **FEATURES OF PROTEIN ENCODED BY GENE NO: 41**

This gene is expressed primarily in human testes tumor and bone marrow.

Therefore, polynucleotides and polypeptides of the invention are useful as
30 reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
20 not limited to, disorders of the testicles including but not limited to testicular
cancer and immune system disorders. Similarly, polypeptides and antibodies directed
35 to these polypeptides are useful in providing immunological probes for differential
identification of the tissue(s) or cell type(s). For a number of disorders of the above
tissues or cells, particularly of the male reproductive system and immune system
40 expression of this gene at significantly higher or lower levels is routinely detected in
certain tissues or cell types (e.g., reproductive, immune, cancerous and wounded
tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or
45 another tissue or cell sample taken from an individual having such a disorder, relative
to the standard gene expression level, i.e., the expression level in healthy tissue or
30 bodily fluid from an individual not having the disorder.

5 Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 164 as residues: His-31 to Gly-41. Polynucleotides
10 encoding said polypeptides are also provided.

5 The tissue distribution in testes, particularly testicular tumors, indicates that
polynucleotides and polypeptides corresponding to this gene are useful for the
treatment and diagnosis of conditions concerning proper testicular function (e.g.
15 endocrine function, sperm maturation), as well as cancer. Therefore, this gene product
is useful in the treatment of male infertility and/or impotence. This gene product is
also useful in assays designed to identify binding agents, as such agents (antagonists)
20 are useful as male contraceptive agents. Similarly, the protein is believed to be useful
in the treatment and/or diagnosis of testicular cancer. The testes are also a site of
active gene expression of transcripts that is expressed, particularly at low levels, in
other tissues of the body. Therefore, this gene product is expressed in other specific
25 tissues or organs where it may play related functional roles in other processes, such as
hematopoiesis, inflammation, bone formation, and kidney function, to name a few
possible target indications. The tissue distribution in bone marrow indicates
30 polynucleotides and polypeptides corresponding to this gene are useful for the
diagnosis and treatment of a variety of immune system disorders. Representative uses
are described in the "Immune Activity" and "infectious disease" sections below, in
20 Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the
expression of this gene product indicates a role in regulating the proliferation;
35 survival; differentiation; and/or activation of hematopoietic cell lineages, including
blood stem cells. This gene product is involved in the regulation of cytokine
production, antigen presentation, or other processes suggesting a usefulness in the
40 25 treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene
product is involved in immune functions. Therefore it is also useful as an agent for
45 immunological disorders including arthritis, asthma, immunodeficiency diseases such
as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
30 bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
50 tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity

5 disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic
10 lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
Disease, and scleroderma. Moreover, the protein may represent a secreted factor that
influences the differentiation or behavior of other blood cells, or that recruits
5 hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in
the expansion of stem cells and committed progenitors of various blood lineages, and
15 in the differentiation and/or proliferation of various cell types. Furthermore, the
protein may also be used to determine biological activity, raise antibodies, as tissue
markers, to isolate cognate ligands or receptors, to identify agents that modulate their
20 interactions, in addition to its use as a nutritional supplement. Protein, as well as,
antibodies directed against the protein may show utility as a tumor marker and/or
immunotherapy targets for the above listed tissues.

25 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
15 related to SEQ ID NO:51 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
30 cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
20 formula of a-b, where a is any integer between 1 to 2045 of SEQ ID NO:51, b is an
integer of 15 to 2059, where both a and b correspond to the positions of nucleotide
35 residues shown in SEQ ID NO:51, and where b is greater than or equal to a + 14.

40 FEATURES OF PROTEIN ENCODED BY GENE NO: 42

25 The translation product of this gene shares sequence homology with
protocadherins, which are related to cadherin, and possess cell adhesive ability.
Cadherins are glycosylated integral membrane proteins that are involved in cell-cell
45 adhesion.

30 This gene is expressed primarily in brain (infant, adult frontal lobe, manic
depression tissue) and to a lesser extent in epididymus, healing groin wounds, ovary,
adipocytes, and fetal tissue (e.g., kidney and retina).

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, neurodegenerative disorders, impaired male and female fertility, developmental disorders, fibrosis, and manic depression. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the nervous system and reproductive system expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, reproductive, cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 165 as residues: Val-35 to Lys-41, Ser-68 to Gln-73, Glu-88 to Glu-93, Arg-156 to Gly-163, Ala-199 to Gly-206, Asp-216 to Ser-226, Thr-249 to Asn-254, Asp-339 to Pro-345, Ile-370 to Gly-379, Pro-429 to Glu-434, Arg-461 to Pro-466, Ala-475 to Thr-482, Pro-585 to Gly-593, Glu-631 to Gln-639, Pro-674 to Pro-682, Gln-715 to Gly-720, Ser-736 to Arg-742. Polynucleotides encoding said polypeptides are also provided.

BLAST analysis reveals high homology to protocadherin sequences. These sequences are related to cadherin, and possess cell adhesive ability. Such proteins may have regulatory functions in the cell, as well as the cell-cell adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of these protocadherins, and can be used therapeutically. The tissue distribution in brain indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease,

5 Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis,
encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma,
10 congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms,
hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive
5 disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism,
and altered behaviors, including disorders in feeding, sleep patterns, balance, and
15 perception. In addition, elevated expression of this gene product in regions of the
brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation,
20 neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or
survival. The tissue distribution in epididymus indicates that polynucleotides and
polypeptides corresponding to this gene are useful for the treatment and diagnosis of
conditions concerning proper testicular function (e.g. endocrine function, sperm
25 maturation), as well as cancer. Therefore, this gene product is useful in the treatment
of male infertility and/or impotence. This gene product is also useful in assays
15 designed to identify binding agents, as such agents (antagonists) are useful as male
contraceptive agents. Similarly, the protein is believed to be useful in the treatment
and/or diagnosis of testicular cancer. The testes are also a site of active gene
expression of transcripts that is expressed, particularly at low levels, in other tissues
20 of the body. Therefore, this gene product is expressed in other specific tissues or
organs where it may play related functional roles in other processes, such as
35 hematopoiesis, inflammation, bone formation, and kidney function, to name a few
possible target indications. Moreover, the expression within fetal tissue (e.g., kidney
and retina) and other cellular sources marked by proliferating cells indicates this
40 protein may play a role in the regulation of cellular division, and may show utility in
the diagnosis, treatment, and/or prevention of developmental diseases and disorders,
including blindness, cancer, and other proliferative conditions. Representative uses
45 are described in the "Hyperproliferative Disorders" and "Regeneration" sections
below and elsewhere herein. Briefly, developmental tissues rely on decisions
30 involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell
50 death, as occurs in the development of some cancers, or in failure to control the extent

of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:52 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 3268 of SEQ ID NO:52, b is an integer of 15 to 3282, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:52, and where b is greater than or equal to a + 14.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, neurodegenerative disorders, impaired CNS function, male sterility, and breast cancer. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the nervous and reproductive systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, male reproductive, cancerous and wounded tissues) or bodily fluids (e.g., amniotic, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 166 as residues: Pro-22 to Pro-31, Ser-38 to His-43, Asp-74 to Leu-79, Asp-113 to Glu-121, Leu-157 to Val-166, Ala-189 to Arg-196, Gln-206 to Arg-211. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in brain, particularly in the cerebellum, indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:53 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general

formula of a-b, where a is any integer between 1 to 1846 of SEQ ID NO:53, b is an integer of 15 to 1860, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:53, and where b is greater than or equal to a + 14.

5 FEATURES OF PROTEIN ENCODED BY GENE NO: 44

Contact of cells with supernatant expressing the product of this gene increases the permeability of monocytes to calcium. Thus, it is likely that the product of this gene is involved in a signal transduction pathway that is initiated when the product of this gene binds a receptor on the surface of the monocyte cell. Thus, polynucleotides and polypeptides have uses which include, but are not limited to, activating monocyte cells.

This gene is expressed primarily in CD34 positive cells derived from human cord blood.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, hematopoietic disorders; immune dysfunction; defects in hematopoietic stem and progenitor cells; susceptibility to chemotherapy and irradiation. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 167 as residues: Ala-38 to Leu-59, Ala-63 to Thr-71, Lys-82 to Leu-91, Glu-97 to Ser-107, Gln-143 to Ala-149, Ile-153 to Leu-158, Ser-169 to Arg-182. Polynucleotides encoding said polypeptides are also provided.

Elevated expression of this gene product in CD34 positive hematopoietic cells indicates that it is expressed by early stem and progenitor cells of the hematopoietic lineages. Therefore, this may represent a soluble factor that is able to control the survival, proliferation, differentiation, or activation of all hematopoietic lineages, including stem and progenitor cells. Thus, it could be quite useful, for example, in ex vivo expansion of stem cell numbers for hematopoietic disorders or for cancer patients. Alternately, it may represent a factor that influences the hematopoietic microenvironment by affecting stromal cells that release other factors required for hematopoietic development. Additionally, the tissue distribution in CD34 positive cells also indicates polynucleotides and polypeptides corresponding to this gene are useful for the treatment and diagnosis of hematopoietic related disorders such as anemia, pancytopenia, leukopenia, thrombocytopenia or leukemia since stromal cells are important in the production of cells of hematopoietic lineages. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the uses include bone marrow cell ex-vivo culture, bone marrow transplantation, bone marrow reconstitution, radiotherapy or chemotherapy of neoplasia.

The gene product may also be involved in lymphopoiesis, therefore, it can be used in immune disorders such as infection, inflammation, allergy, immunodeficiency etc. In addition, this gene product may have commercial utility in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:54 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 756 of SEQ ID NO:54, b is an integer of 15 to 770, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:54, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 45

This gene is expressed primarily in breast and 12-week old human embryos and to a lesser extent in stomach cancer and liver.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, breast cancer; stomach cancer; embryonic defects; hepatic disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the digestive and endocrine systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution indicates that the protein products of this gene are useful for the diagnosis and/or treatment of a variety of disorders. Elevated expression of this gene product in stomach cancer indicates it is useful as a marker or therapeutic target for stomach cancer. Alternately, expression in breast tissue is influenced by the presence or absence of breast cancer tissue, and may thus also serve as a diagnostic marker for this cancer as well. Expression in the developing embryo may correlate with the normal development of human embryos, and expression in the liver is involved in the regulation of normal liver function and/or liver regeneration.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:55 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general

formula of a-b, where a is any integer between 1 to 1079 of SEQ ID NO:55, b is an integer of 15 to 1093, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:55, and where b is greater than or equal to a + 14.

5 FEATURES OF PROTEIN ENCODED BY GENE NO: 46

This gene is expressed primarily in human hypothalamus derived from a patient with schizophrenia.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, schizophrenia; neurological disorders; impaired nervous system function. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the nervous system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 169 as residues: Glu-34 to Trp-39. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in brain, particularly in the hypothalamus, indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal

5

extent in muscle and other hematopoietic cell lineages.

20

Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
10 biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, hematopoietic disorders; immune dysfunction; osteoporosis;
osteopetrosis; muscle degeneration. Similarly, polypeptides and antibodies directed to
these polypeptides are useful in providing immunological probes for differential
25 identification of the tissue(s) or cell type(s). For a number of disorders of the above
15 tissues or cells, particularly of the skeletal and immune systems, expression of this
gene at significantly higher or lower levels is routinely detected in certain tissues or
cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma,
30 urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an
individual having such a disorder, relative to the standard gene expression level, i.e.,
20 the expression level in healthy tissue or bodily fluid from an individual not having the
disorder.

35

Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 170 as residues: Cys-65 to Ser-71. Polynucleotides
encoding said polypeptides are also provided.

40

25 The tissue distribution and homology to lecithin-cholesterol acyltransferase
(LCAT) indicates that polynucleotides and polypeptides corresponding to this gene
are useful for the diagnosis and/or treatment of a variety of disorders. For example,
45 atherosclerosis is a pathological condition of mammals characterised by the
accumulation of cholesterol in the arteries, which leads to heart disease, strokes, heart
30 attacks and peripheral vascular disease. The enzyme could be used in a novel method
of treating atherosclerosis, which involves increasing the level of LCAT activity,
50 which then causes a decrease in the accumulation of cholesterol. The method and the

55

5 products can be used for the prophylaxis and treatment of atherosclerosis, and
associated heart disease, myocardial infarction, stroke and peripheral vascular disease,
10 as well as individuals suffering from Fish Eye Syndrome (caused by LCAT
deficiency) or Classic LCAT Deficiency Syndrome. Alternately, elevated expression
5 of this gene product in osteoblasts and hematopoietic cell lineages indicates that it
may play additional roles in bone turnover, regulation of immune system function,
15 and muscular function.

Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
20 related to SEQ ID NO:57 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
25 more polynucleotides comprising a nucleotide sequence described by the general
15 formula of a-b, where a is any integer between 1 to 2673 of SEQ ID NO:57, b is an
integer of 15 to 2687, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:57, and where b is greater than or equal to a + 14.
30

FEATURES OF PROTEIN ENCODED BY GENE NO: 48

20 When tested against HELA epithelial cell lines, supernatants removed from
cells containing this gene activated the GAS assay. Thus, it is likely that this gene
35 activates epithelial cells through the Jak-STAT signal transduction pathway. The
gamma activating sequence (GAS) is a promoter element found upstream of many
genes which are involved in the Jak-STAT pathway. The Jak-STAT pathway is a
40 25 large, signal transduction pathway involved in the differentiation and proliferation of
cells. Therefore, activation of the Jak-STAT pathway, reflected by the binding of the
GAS element, can be used to indicate proteins involved in the proliferation and
45 differentiation of cells.

This gene is expressed primarily in adult brain, infant brain, fibroblasts,
30 embryonic and fetal tissue (e.g., spleen, liver), placenta and to a lesser extent in
endocrine organs, cancerous colon and breast.
50
55

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, dementia, epilepsy, schizophrenia, and developmental abnormalities.

Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the neural system, endocrine system, and during development, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in brain indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. In addition, the expression of this gene product in synovium (synovial sarcoma) would suggest a role in the detection and treatment of disorders and

5 conditions afflicting the skeletal system, in particular osteoporosis, bone cancer,
connective tissue disorders (e.g. arthritis, trauma, tendonitis, chondromalacia and
10 inflammation). The protein is also useful in the diagnosis or treatment of various
autoimmune disorders (i.e., rheumatoid arthritis, lupus, scleroderma, and
5 dermatomyositis), dwarfism, spinal deformation, joint abnormalities, and
chondrodysplasias (i.e. spondyloepiphyseal dysplasia congenita, familial
15 osteoarthritis, Atelosteogenesis type II, metaphyseal chondrodysplasia type Schmid,
etc.). The tissue distribution in endocrine tissues indicates polynucleotides and
polypeptides corresponding to this gene are useful for the detection, treatment, and/or
20 prevention of various endocrine disorders and cancers. Representative uses are
described in the "Biological Activity", "Hyperproliferative Disorders", and "Binding
Activity" sections below, in Example 11, 17, 18, 19, 20 and 27, and elsewhere herein.
Briefly, the protein can be used for the detection, treatment, and/or prevention of
25 Addison's Disease, Cushing's Syndrome, and disorders and/or cancers of the
pancreas (e.g. diabetes mellitus), adrenal cortex, ovaries, pituitary (e.g., hyper-,
15 hypopituitarism), thyroid (e.g. hyper-, hypothyroidism), parathyroid (e.g. hyper-,
hypoparathyroidism), hypothalamus, and testes. Additionally, the expression within
30 fetal tissue, cancerous colon and breast, and other cellular sources marked by
proliferating cells indicates this protein may play a role in the regulation of cellular
20 division, and may show utility in the diagnosis, treatment, and/or prevention of
developmental diseases and disorders, including cancer, and other proliferative
35 conditions. Representative uses are described in the "Hyperproliferative Disorders"
and "Regeneration" sections below and elsewhere herein. Briefly, developmental
tissues rely on decisions involving cell differentiation and/or apoptosis in pattern
40 25 formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell
death, as occurs in the development of some cancers, or in failure to control the extent
45 of cell death, as is believed to occur in acquired immunodeficiency and certain
neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of
30 potential roles in proliferation and differentiation, this gene product may have
applications in the adult for tissue regeneration and the treatment of cancers. It may
50 also act as a morphogen to control cell and tissue type specification. Therefore, the

polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:58 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 605 of SEQ ID NO:58, b is an integer of 15 to 619, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:58, and where b is greater than or equal to a + 14.

25 FEATURES OF PROTEIN ENCODED BY GENE NO: 49

Preferred polypeptides of the invention comprise the following amino acid sequence or a subfragment thereof: MNKEDKVWNDCKGVNKLTNLEEQYIILIFQ NGLDPPANMVFESIINEIGIKNNISNFFAKIPFEEANGRLVACTRITYEESIKGSC GQKENKIKTVSFESKIQLRSKQEFQFFDEEEETGENHTIFIGPVEKLIVYPPPPA KGGISVTNEDLHCLNEGEFLNDVIIDFYLKYLVEKLKKEDADRIHIFSSFFYK RLNQRERRNHETTNLISIQQRHGRVKTWTRHVDIFEKDFIFVPLNEAAHWFL AVVCFPGLEKPKYEPNPHYHENAVIQKCSTVEDSCISSASEMESCSQNSSAK

PVKKMLNKKHCIAVIDSNPGQEESDPYKRNICSVKYSVKKINHTASENEEF
NKGESTSQKS (SEQ ID NO: 319). Polynucleotides encoding such polypeptides are
also provided.

This gene is expressed primarily in fetal tissue, stomach, brain, endometrial
cells, and bone and to a lesser extent in prostate, retina, adipocytes, smooth muscle,
and tumors of the endometrium, ovaries, and parathyroid.

Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, disorders of the endocrine system, ulcers, stomach cancer, epilepsy,
schizophrenia, dementia, bone growth, developmental disorders and resorption.
Similarly, polypeptides and antibodies directed to these polypeptides are useful in
providing immunological probes for differential identification of the tissue(s) or cell
type(s). For a number of disorders of the above tissues or cells, particularly of the
digestive system and neural systems expression of this gene at significantly higher or
lower levels is routinely detected in certain tissues or cell types (e.g., neural,
endocrine system, cancerous and wounded tissues) or bodily fluids (e.g., serum,
plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken
from an individual having such a disorder, relative to the standard gene expression
level, i.e., the expression level in healthy tissue or bodily fluid from an individual not
having the disorder.

The tissue distribution in brain indicates polynucleotides and polypeptides
corresponding to this gene are useful for the detection, treatment, and/or prevention of
neurodegenerative disease states, behavioral disorders, or inflammatory conditions.
Representative uses are described in the "Regeneration" and "Hyperproliferative
Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly,
the uses include, but are not limited to the detection, treatment, and/or prevention of
Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome,
meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia,
trauma, congenital malformations, spinal cord injuries, ischemia and infarction,
aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive
compulsive disorder, depression, panic disorder, learning disabilities, ALS.

psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Expression of this gene product in stomach tissue indicates involvement in digestion, processing, and elimination of food, as well as a potential role for this gene as a diagnostic marker or causative agent in the development of stomach cancer, and cancer in general. The expression within embryonic, fetal tissue and other cellular sources marked by proliferating cells indicates this protein may play a role in the regulation of cellular division, and may show utility in the diagnosis, treatment, and/or prevention of developmental diseases and disorders, including cancer, and other proliferative conditions. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. The tissue distribution in parathyroid tumor indicates polynucleotides and polypeptides corresponding to this

gene are useful for the detection, treatment, and/or prevention of various endocrine disorders and cancers. Representative uses are described in the "Biological Activity", "Hyperproliferative Disorders", and "Binding Activity" sections below, in Example 11, 17, 18, 19, 20 and 27, and elsewhere herein. Briefly, the protein can be used for the detection, treatment, and/or prevention of Addison's Disease, Cushing's Syndrome, and disorders and/or cancers of the pancreas (e.g. diabetes mellitus), adrenal cortex, ovaries, pituitary (e.g., hyper-, hypopituitarism), thyroid (e.g. hyper-, hypothyroidism), parathyroid (e.g. hyper-, hypoparathyroidism), hypothalamus, and testes. The tissue distribution in testes indicates that polynucleotides and polypeptides corresponding to this gene are useful for the treatment and diagnosis of conditions concerning proper testicular function (e.g. endocrine function, sperm maturation), as well as cancer. Therefore, this gene product is useful in the treatment of male infertility and/or impotence. This gene product is also useful in assays designed to identify binding agents, as such agents (antagonists) are useful as male contraceptive agents. Similarly, the protein is believed to be useful in the treatment and/or diagnosis of testicular cancer. The testes are also a site of active gene expression of transcripts that is expressed, particularly at low levels, in other tissues of the body. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:59 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1364 of SEQ ID NO:59, b is an integer of 15 to 1378, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:59, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 50

The translation product of this gene shares good protein homology with *Xenopus* NaDC-2 gene and a rabbit renal sodium/dicarboxylate cotransporter. The translation product of this gene also shares good homology with a rat placental protein which is a sodium-coupled high affinity dicarboxylate transporter. Therefore, it is likely that the translated product encoded by this gene shares similar biological activity.

This gene is expressed primarily in the placenta and colon adenocarcinoma. Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, developmental abnormalities as well as failure to thrive anomalies. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the female reproductive system and colon, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., amniotic, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 173 as residues: Lys-166 to Gly-181. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in human placenta and the shared homology of this translation product to a rat placental protein indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and/or treatment of disorders of the placenta. Specific expression within the placenta indicates that this gene product may play a role in the proper establishment and maintenance of placental function. Alternately, this gene product is produced by the placenta and then transported to the embryo, where it may play a crucial role in the development and/or

5 survival of the developing embryo or fetus. Expression of this gene product in a
vascular-rich tissue such as the placenta also indicates that this gene product is
10 produced more generally in endothelial cells or within the circulation. In such
instances, it may play more generalized roles in vascular function, such as in
5 angiogenesis. It may also be produced in the vasculature and have effects on other
cells within the circulation, such as hematopoietic cells. It may serve to promote the
15 proliferation, survival, activation, and/or differentiation of hematopoietic cells, as well
as other cells throughout the body. The tissue distribution in colon tissue indicates
that polynucleotides and polypeptides corresponding to this gene are useful for the
20 diagnosis and/or treatment of disorders involving the colon. Expression of this gene
product in colon tissue indicates involvement in digestion, processing, and
elimination of food, as well as a potential role for this gene as a diagnostic marker or
causative agent in the development of colon cancer, and cancer in general.

25 Many polynucleotide sequences, such as EST sequences, are publicly
15 available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:60 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
30 excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
20 more polynucleotides comprising a nucleotide sequence described by the general
formula of a-b, where a is any integer between 1 to 1112 of SEQ ID NO:60, b is an
35 integer of 15 to 1126, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:60, and where b is greater than or equal to a + 14.

40 25 FEATURES OF PROTEIN ENCODED BY GENE NO: 51

This gene is expressed primarily in the spinal cord.

Therefore, polynucleotides and polypeptides of the invention are useful as
45 reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
30 not limited to, paralysis, neurologic disorders. Similarly, polypeptides and antibodies
directed to these polypeptides are useful in providing immunological probes for
50 differential identification of the tissue(s) or cell type(s). For a number of disorders of

5 the above tissues or cells, particularly of the nervous system, expression of this gene
at significantly higher or lower levels is routinely detected in certain tissues or cell
10 types (e.g., neural, cancerous and wounded tissues) or bodily fluids (e.g., serum,
plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken
5 from an individual having such a disorder, relative to the standard gene expression
level, i.e., the expression level in healthy tissue or bodily fluid from an individual not
15 having the disorder.

The tissue distribution in spinal cord indicates polynucleotides and
polypeptides corresponding to this gene are useful for the detection, treatment, and/or
20 10 prevention of neurodegenerative disease states, behavioral disorders, or inflammatory
conditions. Representative uses are described in the "Regeneration" and
"Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and
elsewhere herein. Briefly, the uses include, but are not limited to the detection,
25 treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease,
15 Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating
diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal
cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia,
30 mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder,
learning disabilities, ALS, psychoses, autism, and altered behaviors, including
20 disorders in feeding, sleep patterns, balance, and perception. In addition, elevated
expression of this gene product in regions of the brain indicates it plays a role in
35 normal neural function.

Potentially, this gene product is involved in synapse formation,
neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or
40 25 survival. Furthermore, the protein may also be used to determine biological activity,
to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to
identify agents that modulate their interactions, in addition to its use as a nutritional
45 supplement. Protein, as well as, antibodies directed against the protein may show
utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

30 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
50 related to SEQ ID NO:61 and may have been publicly available prior to conception of

the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2064 of SEQ ID NO:61, b is an integer of 15 to 2078, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:61, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 52

This gene is expressed primarily in keratinocytes, brain, fetal tissues, pericardium, stomach, and cancerous tissues (e.g., stomach, adrenals, parathyroid, germ cell, colon, breast).

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, skin disorders, neurodegenerative and developmental disorders, heart disease, and cancers. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the cardiovascular and gastrointestinal systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, immune, cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in brain indicates polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions.

Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of

5 Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome,
meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia,
10 trauma, congenital malformations, spinal cord injuries, ischemia and infarction,
aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive
5 compulsive disorder, depression, panic disorder, learning disabilities, ALS,
psychoses, autism, and altered behaviors, including disorders in feeding, sleep
15 patterns, balance, and perception. In addition, elevated expression of this gene product
in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation,
20 neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or
survival. The tissue distribution in keratinocytes indicates polynucleotides and
polypeptides corresponding to this gene are useful for the treatment, diagnosis, and/or
prevention of various skin disorders. Representative uses are described in the
25 "Biological Activity", "Hyperproliferative Disorders", "infectious disease", and
15 "Regeneration" sections below, in Example 11, 19, and 20, and elsewhere herein.
Briefly, the protein is useful in detecting, treating, and/or preventing congenital
disorders (i.e. nevi, moles, freckles, Mongolian spots, hemangiomas, port-wine
30 syndrome), integumentary tumors (i.e. keratoses, Bowen's Disease, basal cell
carcinoma, squamous cell carcinoma, malignant melanoma, Paget's Disease, mycosis
20 fungoides, and Kaposi's sarcoma), injuries and inflammation of the skin (i.e. wounds,
35 rashes, prickly heat disorder, psoriasis, dermatitis), atherosclerosis, urticaria, eczema,
photosensitivity, autoimmune disorders (i.e. lupus erythematosus, vitiligo,
dermatomyositis, morphea, scleroderma, pemphigoid, and pemphigus), keloids, striae,
erythema, petechiae, purpura, and xanthelasma. In addition, such disorders may
40 predispose increased susceptibility to viral and bacterial infections of the skin (i.e.
cold sores, warts, chickenpox, molluscum contagiosum, herpes zoster, boils, cellulitis,
erysipelas, impetigo, tinea, athlete's foot, and ringworm). Moreover, the protein
45 product of this gene may also be useful for the treatment or diagnosis of various
connective tissue disorders (i.e., arthritis, trauma, tendonitis, chondromalacia and
30 inflammation, etc.), autoimmune disorders (i.e., rheumatoid arthritis, lupus,
scleroderma, dermatomyositis, etc.), dwarfism, spinal deformation, joint
50 abnormalities, and chondrodysplasias (i.e. spondyloepiphyseal dysplasia congenita,

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Additionally, the tissue distribution in the pericardium of the heart indicates that the protein is useful in the detection, treatment, and/or prevention of a variety of vascular disorders and conditions, which include, but are not limited to microvascular disease, vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery disease, arteriosclerosis, and/or atherosclerosis. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the

5 protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

10 Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are
5 related to SEQ ID NO:62 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically
15 excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general
20 formula of a-b, where a is any integer between 1 to 748 of SEQ ID NO:62, b is an integer of 15 to 762, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:62, and where b is greater than or equal to a + 14.

25 FEATURES OF PROTEIN ENCODED BY GENE NO: 53

15 This gene is expressed primarily in the brain and in cartilage and to a lesser extent in the retina, activated T-cells, pineal gland, the lungs, and in synovial sarcoma.

30 Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a
20 biological sample and for diagnosis of diseases and conditions which include, but are not limited to, neurological diseases, such as epilepsy and dementia, osteoarthritis, retinopathies, hematopoietic diseases, emphysema, and lung cancer. Similarly,
35 polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For
40 a number of disorders of the above tissues or cells, particularly of the neurologic system, cartilage and musculature, vision, the hematopoietic system, and the
25 pulmonary system expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, immune, cancerous and
45 wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder,
30 relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.
50

5 Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 176 as residues: Arg-34 to Cys-44. Polynucleotides
10 encoding said polypeptides are also provided.

The tissue distribution in brain indicates polynucleotides and polypeptides
5 corresponding to this gene are useful for the detection, treatment, and/or prevention of
neurodegenerative disease states, behavioral disorders, or inflammatory conditions.
15 Representative uses are described in the "Regeneration" and "Hyperproliferative
Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly,
the uses include, but are not limited to the detection, treatment, and/or prevention of
20 Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome,
meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia,
trauma, congenital malformations, spinal cord injuries, ischemia and infarction,
aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive
25 compulsive disorder, depression, panic disorder, learning disabilities, ALS,
15 psychoses, autism, and altered behaviors, including disorders in feeding, sleep
patterns, balance, and perception. In addition, elevated expression of this gene product
in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation,
neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or
20 survival. The tissue distribution in T-cells indicates polynucleotides and polypeptides
corresponding to this gene are useful for the diagnosis and treatment of a variety of
35 immune system disorders. Representative uses are described in the "Immune
Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19,
20, and 27, and elsewhere herein. Briefly, the expression of this gene product
40 25 indicates a role in regulating the proliferation; survival; differentiation; and/or
activation of hematopoietic cell lineages, including blood stem cells. This gene
product is involved in the regulation of cytokine production, antigen presentation, or
45 other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting
immune responses).

30 Since the gene is expressed in cells of lymphoid origin, the natural gene
product is involved in immune functions. Therefore it is also useful as an agent for
50 immunological disorders including arthritis, asthma, immunodeficiency diseases such

5 as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
10 such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
5 disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic
lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
15 Disease, and scleroderma. Moreover, the protein may represent a secreted factor that
influences the differentiation or behavior of other blood cells, or that recruits
hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in
20 the expansion of stem cells and committed progenitors of various blood lineages, and
in the differentiation and/or proliferation of various cell types. The expression of this
gene product in synovium would suggest a role in the detection and treatment of
disorders and conditions afflicting the skeletal system, in particular osteoporosis, bone
25 cancer, connective tissue disorders (e.g. arthritis, trauma, tendonitis, chondromalacia
and inflammation). The protein is also useful in the diagnosis or treatment of various
15 autoimmune disorders (i.e., rheumatoid arthritis, lupus, scleroderma, and
dermatomyositis), dwarfism, spinal deformation, joint abnormalities, and
chondrodysplasias (i.e. spondyloepiphyseal dysplasia congenita, familial
osteoarthritis, Atelosteogenesis type II, metaphyseal chondrodysplasia type Schmid,
20 etc.). Additionally, the expression within fetal tissue and other cellular sources
marked by proliferating cells indicates this protein may play a role in the regulation of
35 cellular division, and may show utility in the diagnosis, treatment, and/or prevention
of developmental diseases and disorders, including cancer, and other proliferative
conditions. Representative uses are described in the "Hyperproliferative Disorders"
40 and "Regeneration" sections below and elsewhere herein. Briefly, developmental
25 tissues rely on decisions involving cell differentiation and/or apoptosis in pattern
formation.

45 Dysregulation of apoptosis can result in inappropriate suppression of cell
death, as occurs in the development of some cancers, or in failure to control the extent
30 of cell death, as is believed to occur in acquired immunodeficiency and certain
neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of
50 potential roles in proliferation and differentiation, this gene product may have

5 applications in the adult for tissue regeneration and the treatment of cancers. It may
also act as a morphogen to control cell and tissue type specification. Therefore, the
10 polynucleotides and polypeptides of the present invention are useful in treating,
detecting, and/or preventing said disorders and conditions, in addition to other types
5 of degenerative conditions. Thus this protein may modulate apoptosis or tissue
differentiation and is useful in the detection, treatment, and/or prevention of
15 degenerative or proliferative conditions and diseases. The protein is useful in
modulating the immune response to aberrant polypeptides, as may exist in
proliferating and cancerous cells and tissues. The protein can also be used to gain new
20 insight into the regulation of cellular growth and proliferation. Furthermore, the
protein may also be used to determine biological activity, to raise antibodies, as tissue
markers, to isolate cognate ligands or receptors, to identify agents that modulate their
interactions, in addition to its use as a nutritional supplement. Protein, as well as,
25 antibodies directed against the protein may show utility as a tumor marker and/or
15 immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
30 available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:63 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
20 excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
35 more polynucleotides comprising a nucleotide sequence described by the general
formula of a-b, where a is any integer between 1 to 1080 of SEQ ID NO:63, b is an
integer of 15 to 1094, where both a and b correspond to the positions of nucleotide
40 residues shown in SEQ ID NO:63, and where b is greater than or equal to a + 14.
25

FEATURES OF PROTEIN ENCODED BY GENE NO: 54

45 This gene is expressed primarily in umbilical vein endothelial cells induced by
IL-4.

30 Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
50 biological sample and for diagnosis of diseases and conditions which include, but are

not limited to, angiogenesis, inflammatory disorders, hematopoietic disease.

Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the angiogenic and hematopoietic systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in endothelial cells indicates polynucleotides and polypeptides corresponding to this gene are useful in the detection, treatment, and/or prevention of vascular conditions, which include, but are not limited to, microvascular disease, vascular leak syndrome, aneurysm, stroke, atherosclerosis, arteriosclerosis, or embolism. For example, this gene product may represent a soluble factor produced by smooth muscle that regulates the innervation of organs or regulates the survival of neighboring neurons. Likewise, it is involved in controlling the digestive process, and such actions as peristalsis. Similarly, it is involved in controlling the vasculature in areas where smooth muscle surrounds the endothelium of blood vessels. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues. The secreted protein can also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, and as nutritional supplements. It may also have a very wide range of biological activities. Representative uses are described in the "Chemotaxis" and "Binding Activity" sections below, in Examples 11, 12, 13, 14, 15, 16, 18, 19, and 20, and elsewhere herein. Briefly, the protein may possess the following activities: cytokine, cell proliferation/differentiation modulating activity or induction of other cytokines; immunostimulating/immunosuppressant activities (e.g. for treating human

5 immunodeficiency virus infection, cancer, autoimmune diseases and allergy);
regulation of hematopoiesis (e.g. for treating anemia or as adjunct to chemotherapy);
10 stimulation or growth of bone, cartilage, tendons, ligaments and/or nerves (e.g. for
treating wounds, stimulation of follicle stimulating hormone (for control of fertility);
5 chemotactic and chemokinetic activities (e.g. for treating infections, tumors);
hemostatic or thrombolytic activity (e.g. for treating hemophilia, cardiac infarction
15 etc.); anti-inflammatory activity (e.g. for treating septic shock, Crohn's Disease); as
antimicrobials; for treating psoriasis or other hyperproliferative diseases; for
regulation of metabolism, and behavior. Also contemplated is the use of the
20 corresponding nucleic acid in gene therapy procedures.

Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:64 and may have been publicly available prior to conception of
25 the present invention. Preferably, such related polynucleotides are specifically
15 excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
30 formula of a-b, where a is any integer between 1 to 1347 of SEQ ID NO:64, b is an
integer of 15 to 1361, where both a and b correspond to the positions of nucleotide
20 residues shown in SEQ ID NO:64, and where b is greater than or equal to a + 14.

35 FEATURES OF PROTEIN ENCODED BY GENE NO: 55

This gene is expressed primarily in both normal and cancerous pancreas.

40 Therefore, polynucleotides and polypeptides of the invention are useful as
25 reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, diabetes, gastrointestinal disorders, and pancreatic cancer. Similarly,
45 polypeptides and antibodies directed to these polypeptides are useful in providing
immunological probes for differential identification of the tissue(s) or cell type(s). For
30 a number of disorders of the above tissues or cells, particularly of the digestive and
blood systems, expression of this gene at significantly higher or lower levels is
50 routinely detected in certain tissues or cell types (e.g., cancerous and wounded

tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in pancreas indicates that the protein products of this gene are useful as a therapeutic and/or diagnostic agent for pancreatic disorders and disorders of the endocrine and exocrine system, including but not limited to diabetes, blood disorders, pancreatic cancer, gastrointestinal diseases, hormonal imbalance, autoimmune disorders, cystic fibrosis, pancreatitis, and gallstones. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:65 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 933 of SEQ ID NO:65, b is an integer of 15 to 947, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:65, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 56

The translation product of this gene shares sequence homology with oxidoreductase. Preferred polypeptides of the invention comprise the following amino acid sequence: MSPLSAARAALRVYAVGAAVILAQLLRRCRGGFLEPVXPPRP
DRVAIVTGGTDGIGYSTANIWRDLGMHVIIAGNNDKAKQVVSKEETLND
KVEFLYCDLASMTSIRQFVQKFKMKKIPLHVLINNAGVMMVPQRKTRDGFEE
HFGLNYLGHFLLTNLLDLTKESGSPGHSARVVTVSSATHYVAELNMDDLQS

SACYSPHAA YAQSKLALVLFTYHLQRLLAAEGSHVTANVVDPGVVNTDXYK
HVFWATRLAKKLLGWLLFKTPDEGAWTSIYAAVTPELEGVGGRYLYNEKET
KSLHVTYNQKLQQQLWSKSCMTGVLDVTL (SEQ ID NO: 320). The mature
form of this protein begins at residue 32. Thus, polypeptides comprising residues 2-
330 and 32-330 of the sequence shown above are also provided. Polynucleotides
encoding such polypeptides are also provided.

A preferred polypeptide fragment of the invention comprises the following
amino acid sequence: MSPLSAARAALRVYAVGAAVILAQLLRRCRGGFLEP
VXPPRPDRVAIVTGGTDGIG YSTANIWRDLACMLS (SEQ ID NO: 321).

Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in breast cancer cells, osteoclastoma, wilm's
tumor, thymus stromal cells, and T cell helper I.

Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, cancer, e.g., breast cancer, osteoclastoma, and wilm's tumor. Similarly,
polypeptides and antibodies directed to these polypeptides are useful in providing
immunological probes for differential identification of the tissue(s) or cell type(s). For
a number of disorders of the above tissues or cells, particularly of the immune system,
expression of this gene at significantly higher or lower levels is routinely detected in
certain tissues or cell types (e.g., reproductive, kidney, immune, hematopoietic, and
cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, breast milk,
urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an
individual having such a disorder, relative to the standard gene expression level, i.e.,
the expression level in healthy tissue or bodily fluid from an individual not having the
disorder.

The tissue distribution in breast cancer tissue, combined with the homology to
oxidoreductase indicates that polynucleotides and polypeptides corresponding to this
gene are useful for diagnosis and treatment of cancer, particularly, breast cancer,
osteoclastoma, and wilm's tumor. This protein may play a role in the regulation of
cellular division, and may show utility in the diagnosis, treatment, and/or prevention
of developmental diseases and disorders, including cancer, and other proliferative

5 conditions. Representative uses are described in the "Hyperproliferative Disorders"
and "Regeneration" sections below and elsewhere herein. Briefly, developmental
10 tissues rely on decisions involving cell differentiation and/or apoptosis in pattern
formation.

5 Dysregulation of apoptosis can result in inappropriate suppression of cell
death, as occurs in the development of some cancers, or in failure to control the extent
15 of cell death, as is believed to occur in acquired immunodeficiency and certain
neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of
potential roles in proliferation and differentiation, this gene product may have
20 applications in the adult for tissue regeneration and the treatment of cancers. It may
also act as a morphogen to control cell and tissue type specification. Therefore, the
polynucleotides and polypeptides of the present invention are useful in treating,
25 detecting, and/or preventing said disorders and conditions, in addition to other types
of degenerative conditions. Thus this protein may modulate apoptosis or tissue
15 differentiation and is useful in the detection, treatment, and/or prevention of
degenerative or proliferative conditions and diseases. The protein is useful in
modulating the immune response to aberrant polypeptides, as may exist in
30 proliferating and cancerous cells and tissues. The protein can also be used to gain new
insight into the regulation of cellular growth and proliferation. Furthermore, the
20 protein may also be used to determine biological activity, to raise antibodies, as tissue
markers, to isolate cognate ligands or receptors, to identify agents that modulate their
35 interactions, in addition to its use as a nutritional supplement. Protein, as well as,
antibodies directed against the protein may show utility as a tumor marker and/or
immunotherapy targets for the above listed tissues.

40 25 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:66 and may have been publicly available prior to conception of
45 the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
30 cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
50 formula of a-b, where a is any integer between 1 to 1362 of SEQ ID NO:66, b is an

integer of 15 to 1376, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:66, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 57

This gene is expressed primarily in monocytes, T cell helper II and B cell lymphoma.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune and hematopoietic diseases and/or disorders, particularly B-cell lymphoma. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, hematopoietic, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 180 as residues: Asp-30 to Val-40. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in monocytes, T cell helper, and B cell lymphoma cells indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of B cell lymphoma. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or

5 other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

10 Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for
5 immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
15 bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
20 disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits
25 hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in
15 the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue
30 markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as,
20 antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

35 Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:67 and may have been publicly available prior to conception of
40 25 the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or
45 more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2420 of SEQ ID NO:67, b is an
30 integer of 15 to 2434, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:67, and where b is greater than or equal to a + 14.

50

55

FEATURES OF PROTEIN ENCODED BY GENE NO: 58

This gene is expressed primarily in human lung cancer.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, pulmonary diseases and/or disorders, particularly cancers of the lung. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., pulmonary, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, pulmonary lavage, pulmonary surfactant, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 181 as residues: Phe-39 to Asp-45. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in lung cancer tissue indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of immune system disorders such as ARDS, cystic fibrosis, and cancer, particularly lung cancer. This protein may play a role in the regulation of cellular division, and may show utility in the diagnosis, treatment, and/or prevention of developmental diseases and disorders, including cancer, and other proliferative conditions. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of

5 potential roles in proliferation and differentiation, this gene product may have
applications in the adult for tissue regeneration and the treatment of cancers. It may
10 also act as a morphogen to control cell and tissue type specification. Therefore, the
polynucleotides and polypeptides of the present invention are useful in treating,
5 detecting, and/or preventing said disorders and conditions, in addition to other types
of degenerative conditions. Thus this protein may modulate apoptosis or tissue
15 differentiation and is useful in the detection, treatment, and/or prevention of
degenerative or proliferative conditions and diseases. The protein is useful in
modulating the immune response to aberrant polypeptides, as may exist in
20 proliferating and cancerous cells and tissues. The protein can also be used to gain new
insight into the regulation of cellular growth and proliferation. Furthermore, the
protein may also be used to determine biological activity, to raise antibodies, as tissue
25 markers, to isolate cognate ligands or receptors, to identify agents that modulate their
interactions, in addition to its use as a nutritional supplement. Protein, as well as,
15 antibodies directed against the protein may show utility as a tumor marker and/or
immunotherapy targets for the above listed tissues.

30 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:68 and may have been publicly available prior to conception of
20 the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
35 cumbersome. Accordingly, preferably excluded from the present invention are one or
more polynucleotides comprising a nucleotide sequence described by the general
formula of a-b, where a is any integer between 1 to 1072 of SEQ ID NO:68, b is an
40 25 integer of 15 to 1086, where both a and b correspond to the positions of nucleotide
residues shown in SEQ ID NO:68, and where b is greater than or equal to a + 14.

45 FEATURES OF PROTEIN ENCODED BY GENE NO: 59

This gene is expressed primarily in larynx carcinoma and early stage human
30 lung.

Therefore, polynucleotides and polypeptides of the invention are useful as
50 reagents for differential identification of the tissue(s) or cell type(s) present in a

5 biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, developmental, gastrointestinal, and pulmonary diseases and/or
10 disorders, particularly larynx carcinoma. Similarly, polypeptides and antibodies
directed to these polypeptides are useful in providing immunological probes for
5 differential identification of the tissue(s) or cell type(s). For a number of disorders of
the above tissues or cells, particularly of the immune system, expression of this gene
15 at significantly higher or lower levels is routinely detected in certain tissues or cell
types (e.g., developmental, gastrointestinal, pulmonary, and cancerous and wounded
tissues) or bodily fluids (e.g., serum, plasma, amniotic fluid, pulmonary lavage,
20 sputum, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken
from an individual having such a disorder, relative to the standard gene expression
level, i.e., the expression level in healthy tissue or bodily fluid from an individual not
having the disorder.

25 Preferred polypeptides of the present invention comprise immunogenic
15 epitopes shown in SEQ ID NO: 182 as residues: His-42 to Lys-49. Polynucleotides
encoding said polypeptides are also provided.

30 The tissue distribution in larynx carcinoma and early stage human lung
indicates that polynucleotides and polypeptides corresponding to this gene are useful
for treating immune system disorders such as cancer, particularly larynx carcinoma.
20 This protein may play a role in the regulation of cellular division, and may show
utility in the diagnosis, treatment, and/or prevention of developmental diseases and
35 disorders, including cancer, and other proliferative conditions. Representative uses are
described in the "Hyperproliferative Disorders" and "Regeneration" sections below
and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell
40 25 differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell
death, as occurs in the development of some cancers, or in failure to control the extent
45 of cell death, as is believed to occur in acquired immunodeficiency and certain
neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of
30 potential roles in proliferation and differentiation, this gene product may have
applications in the adult for tissue regeneration and the treatment of cancers. It may
50 also act as a morphogen to control cell and tissue type specification. Therefore, the

polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:69 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1248 of SEQ ID NO:69, b is an integer of 15 to 1262, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:69, and where b is greater than or equal to a + 14.

25 FEATURES OF PROTEIN ENCODED BY GENE NO: 60

Preferred polypeptides of the invention comprise the following amino acid sequence: MEVTTEDTSRDTDVSEPATSGGAADGVTSIAPTAVASSTTAASITTA
ASSMTVASSAPTTAASSTTVASIAPTTTASSMTAASSTPMTLALPAPTSTXTGR
TPSTTATGHPSLSTALAQVPKSSALPRTATLATLATRAQTVATTANTSSPMST

XEPLTQAVVDKTLVVLLGVTLFTVLVLFALQAYESYKKKDYTQVDYLI

NGMYADSEM (SEQ ID NO: 322). Polynucleotides encoding these polypeptides are also provided.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: ARCPGLPGLRCRPRPRAGPQAPSYPATRRPPG ACCARMRLLEWRVYLRITCATKDGMAECPTTWLSPPAKPDFAQHRSVK PTALQGGWRSLGASP (SEQ ID NO: 323). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in adipocytes, osteoblasts, cerebellum, hypothalamus and Hodgkin's lymphoma.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, metabolic, skeletal, neural, and immune diseases and/or disorders, particularly Hodgkin's lymphoma. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., metabolic, skeletal, neural, immune, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 183 as residues: Pro-33 to Gln-40, Gly-51 to Arg-56. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in Hodgkin's lymphoma cells indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of immune system disorders such as cancer, particularly Hodgkin's lymphoma. The secreted protein can also be used to determine biological activity, to

raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, and as nutritional supplements. It may also have a very wide range of biological activities. Representative uses are described in the "Chemotaxis" and "Binding Activity" sections below, in Examples 11, 12, 13, 14, 15, 16, 18, 19, and 20, and elsewhere herein. Briefly, the protein may possess the following activities: cytokine, cell proliferation/differentiation modulating activity or induction of other cytokines; immunostimulating/immunosuppressant activities (e.g. for treating human immunodeficiency virus infection, cancer, autoimmune diseases and allergy); regulation of hematopoiesis (e.g. for treating anemia or as adjunct to chemotherapy); stimulation or growth of bone, cartilage, tendons, ligaments and/or nerves (e.g. for treating wounds, stimulation of follicle stimulating hormone (for control of fertility); chemotactic and chemokinetic activities (e.g. for treating infections, tumors); hemostatic or thrombolytic activity (e.g. for treating hemophilia, cardiac infarction etc.); anti-inflammatory activity (e.g. for treating septic shock, Crohn's Disease); as antimicrobials; for treating psoriasis or other hyperproliferative diseases; for regulation of metabolism, and behavior. Also contemplated is the use of the corresponding nucleic acid in gene therapy procedures. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:70 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1628 of SEQ ID NO:70, b is an integer of 15 to 1642, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:70, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 61

The translation product of this gene shares sequence homology with polypeptide in the cystatin family. Cystatin polypeptides are cysteine protease inhibitors. For an analysis of the composition of several members of the cystatin family see Gene (1987) 61(3):329-338, incorporated herein by reference. The cystatin activity of polypeptides encoded by this gene is measured by several assays known in the art including assays described in coowned, copending US Patent Application Serial No. 08/744,138, incorporated herein by reference. Preferred polypeptides of the invention comprise the following amino acid sequence: LPATVEFAVHTFNQQSKD YYAYRLGHILNSWKEQVESKTVFSMELLGRTRCGKFEDDIDNCHFQESTEL NNTFTCFFTISTRPWMQFSLNKC (SEQ ID NO: 324). Fragments of such polypeptides having cystatin activity (cysteine protease inhibitory activity are particularly preferred). Polynucleotides encoding such polypeptides are also provided.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: LLWARGLGRAKSAVPTVST MLGLPWKGGLS WALLLLLLGSQILLIYAWHFHEQRDCDEHNVMARYLPATVEFAVHTFNQQS KDYYAYRLGHILNSWKEQVESKTVFSMELLGRTRCGKFEDDIDNCHFQE STELNNTFTCFFTISTRPWMQFSLNK TCLEGFH (SEQ ID NO: 325). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in testes and epididymus. For a review of a cystatin showing testes- specific expression see Mol. Endocrinol. (1992 Oct.) 6(10):1653-1664, incorporated herein by reference.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, They should therefore serve a protective function to regulate the activities of such endogenous proteinases, which otherwise may cause uncontrolled proteolysis and tissue damage. Cysteine proteinase activity can normally not be measured in body fluids, but can be detected extracellularly in conditions like endotoxin-induced sepsis, metastasizing cancer, and at local inflammatory processes

5 in rheumatoid arthritis , purulent bronchiectasis and periodontitis. Similarly,
polypeptides and antibodies directed to these polypeptides are useful in providing
10 immunological probes for differential identification of the tissue(s) or cell type(s). For
a number of disorders of the above tissues or cells, particularly of the immune,
5 expression of this gene at significantly higher or lower levels is routinely detected in
certain tissues or cell types (e.g., reproductive, testicular, and cancerous and wounded
15 tissues) or bodily fluids (e.g., serum, plasma, urine, seminal fluid, synovial fluid and
spinal fluid) or another tissue or cell sample taken from an individual having such a
disorder, relative to the standard gene expression level, i.e., the expression level in
20 healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 184 as residues: Phe-31 to Asp-38, Asn-59 to Tyr-65,
Ser-76 to Glu-82, Thr-96 to Cys-108, Gln-111 to Asn-118. Polynucleotides encoding
25 said polypeptides are also provided.

15 The tissue distribution in testes and epididymus, combined with the
homology to cystatins indicates that polynucleotides and polypeptides corresponding
to this gene are useful for the treatment and diagnosis of conditions concerning proper
30 testicular function (e.g. endocrine function, sperm maturation), as well as cancer.
Therefore, this gene product is useful in the treatment of male infertility and/or
20 impotence. This gene product is also useful in assays designed to identify binding
agents, as such agents (antagonists) are useful as male contraceptive agents. Similarly,
35 the protein is believed to be useful in the treatment and/or diagnosis of testicular
cancer. The testes are also a site of active gene expression of transcripts that is
expressed, particularly at low levels, in other tissues of the body. Therefore, this gene
40 product is expressed in other specific tissues or organs where it may play related
25 functional roles in other processes, such as hematopoiesis, inflammation, bone
formation, and kidney function, to name a few possible target indications.
Representative uses are described in the "Hyperproliferative Disorders" and
45 "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues
30 rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell
50 death, as occurs in the development of some cancers, or in failure to control the extent

5 of cell death, as is believed to occur in acquired immunodeficiency and certain
neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of
10 potential roles in proliferation and differentiation, this gene product may have
applications in the adult for tissue regeneration and the treatment of cancers. It may
5 also act as a morphogen to control cell and tissue type specification. Therefore, the
polynucleotides and polypeptides of the present invention are useful in treating,
15 detecting, and/or preventing said disorders and conditions, in addition to other types
of degenerative conditions. Thus this protein may modulate apoptosis or tissue
differentiation and is useful in the detection, treatment, and/or prevention of
20 degenerative or proliferative conditions and diseases. The protein is useful in
modulating the immune response to aberrant polypeptides, as may exist in
proliferating and cancerous cells and tissues. The protein can also be used to gain new
insight into the regulation of cellular growth and proliferation. Furthermore, the
25 protein may also be used to determine biological activity, to raise antibodies, as tissue
15 markers, to isolate cognate ligands or receptors, to identify agents that modulate their
interactions, in addition to its use as a nutritional supplement. Protein, as well as,
antibodies directed against the protein may show utility as a tumor marker and/or
30 immunotherapy targets for the above listed tissues.

Cysteine proteinase inhibitors of the cystatin superfamily are ubiquitous in the
20 body and are generally tight-binding inhibitors of papain-like cysteine proteinases,
35 such as cathepsins B, H, L, S, and K. They should therefore serve a protective
function to regulate the activities of such endogenous proteinases, which otherwise
may cause uncontrolled proteolysis and tissue damage. Cysteine proteinase activity
can normally not be measured in body fluids, but can be detected extracellularly in
40 25 conditions like endotoxin-induced sepsis, metastasizing cancer, and at local
inflammatory processes in rheumatoid arthritis, purulent bronchiectasis and
periodontitis, which indicates that a tight cystatin regulation is a necessity in the
45 normal state. A deficiency state in which the levels of the intracellular cystatin,
cystatin B, are lowered due to mutations has recently been shown to segregate with a
30 form of progressive myoclonus epilepsy, which points to additional specialized
functions of cystatins. Moreover, results showing that chicken cystatin inhibits polio
50 virus replication, human cystatin C inhibits corona- and herpes simplex virus

replication, and human cystatin A inhibits rhabdovirus-induced apoptosis in cell cultures indicates that cystatins play additional roles in the human defense system. The cystatins constitute a superfamily of evolutionarily related proteins, all composed of at least one 100-120 residue domain with conserved sequence motifs.

The previously well characterized single-domain human members of this superfamily could be grouped in two protein families. The Family 1 members, cystatins (or stefins) A and B, contain approximately 100 amino acid residues, lack disulfide bridges, and are not synthesized as preproteins with signal peptides. The Family 2 cystatins (cystatins C, D, S, SN, and SA) are secreted proteins of approximately 120 amino acid residues (Mr 13,000-14,000) and have two characteristic intrachain disulfide bonds. Recently, we identified an additional human cystatin superfamily member by EST1 sequencing in epithelial cell derived cDNA libraries which we named cystatin E. The same cystatin was independently discovered by differential display experiments as a mRNA species down-regulated in breast tumor tissue, but present in the surrounding epithelium and reported under the name cystatin M. Cystatin E/M is an atypical, secreted low-Mr cystatin in that it is a glycoprotein and just shows 30-35% sequence identity in alignments with the human Family 2 cystatins, which shows that additional cystatin families are yet to be identified. The cystatin E/M gene has been localized to chromosome 2, whereas all human Family 2 cystatin genes are clustered on the short arm of chromosome 20, which further stresses that cystatin E/M is just distantly related to the other secreted human low-Mr cystatins. It is believed therefore, that polypeptides encoded by this gene are useful in diagnosing and treating disease consistent with the aforementioned conditions in which cystatins are implicated.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:71 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 907 of SEQ ID NO:71, b is an

integer of 15 to 921, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:71, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 62

The translation product of this gene shares sequence homology with Neutrophil Gelatinase-Associated Lipocalin which is thought to be important in immune regulation (See Genbank and Geneseq Accession Nos. embiCAA58127.1, and U55627034, respectively; all references and information available through these accessions are hereby incorporated herein by reference; for example, Biochem. Biophys. Res. Commun. 202 (3), 1468-1475 (1994), and FEBS Lett. 314 (3), 386-388 (1992)).

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: LEQKLELHRGGGRSRTSGSPGLQEFGTREERGE GEQRTGREFSGNGGRAVEAARMRLCGLWLWLSLLKVLQAQTPTPLPLPP PMQSFQGNQFQGEWFLGLAGNSFRPEHRALLNAFTATFELSDDGREFVWN AMTRGQHCDTWSYVLIPAAQPGQFTVDHGVGRSWLLPPGTLDQFICLGRAQ GLSDDNIVFPDVTGXALDL XSLPWVAAPA (SEQ ID NO: 326). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in epididymus and osteoclastoma.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, reproductive and skeletal diseases and/or disorders, particularly cancers such as osteoclastoma testicular cancer. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., reproductive, testicular, skeletal, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, seminal fluid, urine, synovial fluid and spinal fluid)

5 or another tissue or cell sample taken from an individual having such a disorder,
relative to the standard gene expression level, i.e., the expression level in healthy
10 tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic
5 epitopes shown in SEQ ID NO: 185 as residues: Met-82 to Thr-90. Polynucleotides
encoding said polypeptides are also provided.

15 The tissue distribution in epididymus and homology to neutrophil gelatinase-
associated lipocalin indicates that polynucleotides and polypeptides corresponding to
this gene are useful for diagnosis and treatment of skin diseases and immune system
20 disorders such as cancer, particularly osteoclastoma. The secreted protein can also be
used to determine biological activity, to raise antibodies, as tissue markers, to isolate
cognate ligands or receptors, to identify agents that modulate their interactions, and as
nutritional supplements. It may also have a very wide range of biological activities.
25 Representative uses are described in the "Chemotaxis" and "Binding Activity"
sections below, in Examples 11, 12, 13, 14, 15, 16, 18, 19, and 20, and elsewhere
herein. Briefly, the protein may possess the following activities: cytokine, cell
30 proliferation/differentiation modulating activity or induction of other cytokines;
immunostimulating/immunosuppressant activities (e.g. for treating human
immunodeficiency virus infection, cancer, autoimmune diseases and allergy);
20 regulation of hematopoiesis (e.g. for treating anemia or as adjunct to chemotherapy);
stimulation or growth of bone, cartilage, tendons, ligaments and/or nerves (e.g. for
35 treating wounds, stimulation of follicle stimulating hormone (for control of fertility);
chemotactic and chemokinetic activities (e.g. for treating infections, tumors);
hemostatic or thrombolytic activity (e.g. for treating hemophilia, cardiac infarction
40 etc.); anti-inflammatory activity (e.g. for treating septic shock, Crohn's Disease); as
antimicrobials; for treating psoriasis or other hyperproliferative diseases; for
regulation of metabolism, and behavior. Also contemplated is the use of the
45 corresponding nucleic acid in gene therapy procedures. Protein, as well as, antibodies
directed against the protein may show utility as a tumor marker and/or
30 immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
50 available and accessible through sequence databases. Some of these sequences are

related to SEQ ID NO:72 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 892 of SEQ ID NO:72, b is an integer of 15 to 906, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:72, and where b is greater than or equal to a + 14.

10 **FEATURES OF PROTEIN ENCODED BY GENE NO: 63**

The translation product of this gene was shown to have homology to colipase which plays an essential role in the intestinal fat digestion by anchoring lipase on lipid/water interfaces in the presence of bile salts (See Genbank Accession No. gbIAA03513.1; all references and information available through this accession are hereby incorporated by reference herein).

This gene is expressed primarily in epididymus.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, reproductive diseases and/or disorders, particularly epididymus-related diseases. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., reproductive, metabolic, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, seminal fluid, bile, chyme, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 186 as residues: Ile-40 to Cys-49, Arg-52 to Cys-57,

Ser-94 to Trp-99, Gly-105 to Gly-111. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in epididymus indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of immune system diseases and disorders of the epididymus. Polynucleotides and polypeptides corresponding to this gene are useful for the treatment and diagnosis of conditions concerning proper testicular function (e.g. endocrine function, sperm maturation), as well as cancer. Therefore, this gene product is useful in the treatment of male infertility and/or impotence. This gene product is also useful in assays designed to identify binding agents, as such agents (antagonists) are useful as male contraceptive agents. Similarly, the protein is believed to be useful in the treatment and/or diagnosis of testicular cancer. The testes are also a site of active gene expression of transcripts that is expressed, particularly at low levels, in other tissues of the body. Therefore, this gene product is expressed in other specific tissues or organs where it may play related functional roles in other processes, such as hematopoiesis, inflammation, bone formation, and kidney function, to name a few possible target indications. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:73 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 666 of SEQ ID NO:73, b is an integer of 15 to 680, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:73, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 64

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: MCVCKERKRGREKEGGVTPTMTSNFPFCTLILGI
AQAQACPGCPGDWPGLGSGVGEGLHHIRTCRTPIPCSPAPAAACLGSGH
ARLPCVLRLLWPVPANLSSPFRLEALHCSFWSSPLLPAPIILAFFGFRDLLTDFL
LAACLLTFQKTPLELPMAVVHLLVATPCYQMLDNLPLPSAAAN WC (SEQ ID
NO: 327). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in melanocytes and placenta and to a lesser extent in bone marrow and many cells of the immune system, including B-cells, dendritic cells, and T-cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, skin cancer and disorders of the reproductive and immune systems. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the reproductive and immune systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues and cell types (e.g., reproductive tissue, hematopoietic tissue, melanocytes and cells and tissue of the immune system, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, amniotic fluid, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in melanocytes indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of disorders affecting the skin, the reproductive system, and the immune system, particularly cancers. Representative uses are described in the "Biological Activity".

"Hyperproliferative Disorders", "infectious disease", and "Regeneration" sections below, in Example 11, 19, and 20, and elsewhere herein. Briefly, the protein is useful in detecting, treating, and/or preventing congenital disorders (i.e. nevi, moles, freckles, Mongolian spots, hemangiomas, port-wine syndrome), integumentary tumors (i.e. keratoses, Bowen's Disease, basal cell carcinoma, squamous cell carcinoma, malignant melanoma, Paget's Disease, mycosis fungoides, and Kaposi's sarcoma), injuries and inflammation of the skin (i.e. wounds, rashes, prickly heat disorder, psoriasis, dermatitis), atherosclerosis, urticaria, eczema, photosensitivity, autoimmune disorders (i.e. lupus erythematosus, vitiligo, dermatomyositis, morphea, scleroderma, pemphigoid, and pemphigus), keloids, striae, erythema, petechiae, purpura, and xanthelasma. In addition, such disorders may predispose increased susceptibility to viral and bacterial infections of the skin (i.e. cold sores, warts, chickenpox, molluscum contagiosum, herpes zoster, boils, cellulitis, erysipelas, impetigo, tinea, athlete's foot, and ringworm). Moreover, the protein product of this gene may also be useful for the treatment or diagnosis of various connective tissue disorders (i.e., arthritis, trauma, tendonitis, chondromalacia and inflammation, etc.), autoimmune disorders (i.e., rheumatoid arthritis, lupus, scleroderma, dermatomyositis, etc.), dwarfism, spinal deformation, joint abnormalities, and chondrodysplasias (i.e. spondyloepiphyseal dysplasia congenita, familial osteoarthritis, Atelosteogenesis type II, metaphyseal chondrodysplasia type Schmid). Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:74 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general

formula of a-b, where a is any integer between 1 to 1619 of SEQ ID NO:74, b is an integer of 15 to 1633, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:74, and where b is greater than or equal to a + 14.

5 FEATURES OF PROTEIN ENCODED BY GENE NO: 65

Preferred polypeptides of the invention comprise the following amino acid sequence: YLWGRPRLRMAGTSPSAPWGEKREKLGHKLPVALQGYHPWIL
LECTVFWARVVLACFSLYLIRGPNICINRQPEPTYQKACNLDCSSDFGQER
APAWELLGPESEQLREYTAQGLQSLASSHRWRQFKTEGKMRGGASPLPWLI
CFW LCSYKGS DNSLKPVPVPGPTLCPQSLVSPSVHPSTRSASLGRHRAEAA
(SEQ ID NO: 328). Polynucleotides encoding these polypeptides are also provided.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: MPGILAGIPVKDLCLSLQGFRLLLLCVCPGWL
SGWMGGQKGSPRIVDIG (SEQ ID NO: 329). Polynucleotides encoding these polypeptides are also provided. This gene maps to chromosome 15, accordingly, polynucleotides of the invention is used in linkage analysis as a marker for chromosome 15.

This gene is expressed primarily in brain and breast and to a lesser extent in the liver, pancreas, and T-cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, disorders affecting the brain and CNS, the reproductive system, or the immune system. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the central nervous system, the reproductive system, and the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., brain and other tissue of the nervous system, mammary tissue, endocrine tissue, hepatic tissue, reproductive tissue, cells

5 and tissue of the immune system, cancerous and wounded tissues) or bodily fluids
(e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell
10 sample taken from an individual having such a disorder, relative to the standard gene
expression level, i.e., the expression level in healthy tissue or bodily fluid from an
5 individual not having the disorder.

15 Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 188 as residues: Met-37 to Ser-43. Polynucleotides
encoding said polypeptides are also provided.

20 The tissue distribution in brain cells indicates that polynucleotides and
10 polypeptides corresponding to this gene are useful for the diagnosis and treatment of
disorders affecting the central nervous system, the reproductive system, and the
immune system, including cancers. Representative uses are described in the
"Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11,
25 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the
detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease,
Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating
30 diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal
cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia,
mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder,
20 learning disabilities, ALS, psychoses, autism, and altered behaviors, including
disorders in feeding, sleep patterns, balance, and perception. In addition, elevated
35 expression of this gene product in regions of the brain indicates it plays a role in
normal neural function.

40 Potentially, this gene product is involved in synapse formation,
25 neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or
survival. Furthermore, the protein may also be used to determine biological activity,
to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to
45 identify agents that modulate their interactions, in addition to its use as a nutritional
supplement. Protein, as well as, antibodies directed against the protein may show
30 utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

50 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are

related to SEQ ID NO:75 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1008 of SEQ ID NO:75, b is an integer of 15 to 1022, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:75, and where b is greater than or equal to a + 14.

10 20 **FEATURES OF PROTEIN ENCODED BY GENE NO: 66**

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: AKGEERKEAFSLKMOVLSSEPISFGLMYLYLGV FFHLIYPGALSITTLGKHSHPFETAEQNSTVWMEHTLFHQSPVASHLVCFQSF AFSE (SEQ ID NO: 330). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in the brain and the immune system, in particular T-cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, disorders affecting the brain, such as Alzheimer's or disorders affecting the immune system, such as AIDS. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the brain and CNS and the immune systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues and cell types (e.g., brain and other tissue of the nervous system, cells and tissue of the immune system, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene

expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in brain cells and tissues indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of disorders affecting the brain and CNS or disorders affecting the immune system. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:76 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1170 of SEQ ID NO:76, b is an

integer of 15 to 1184, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:76, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 67

The translation product of this gene shares sequence homology with penacidin-2 which is thought to be a members of a new family of antimicrobial peptides from the hemolymph of shrimps *Penaeus vannamei*. The molecules display antimicrobial activity against fungi and bacteria with a predominant activity against Gram-positive bacteria.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: GPAHPASPPLMTLSLQLAELVHFVCAFAQSQWTGVYPMMPPLKPTPLCFA CVPCR (SEQ ID NO: 331). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in spleen.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune and hematopoietic diseases and/or disorders, particularly disorders affecting the spleen, including bacterial and fungal infections. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the hematopoietic and immune systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues and cell types (e.g., immune, hematopoietic, and cells and tissue of the immune system, cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

5 The tissue distribution in spleen and homology to the penaeidin family of
antibiotics indicates that polynucleotides and polypeptides corresponding to this gene
10 are useful for the diagnosis and treatment of disorders affecting the spleen, especially
fungal and bacterial infections. Representative uses are described in the "Immune
5 Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19,
20, and 27, and elsewhere herein. Briefly, the expression of this gene product
15 indicates a role in regulating the proliferation; survival; differentiation; and/or
activation of hematopoietic cell lineages, including blood stem cells. This gene
product is involved in the regulation of cytokine production, antigen presentation, or
20 other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting
immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene
product is involved in immune functions. Therefore it is also useful as an agent for
25 immunological disorders including arthritis, asthma, immunodeficiency diseases such
15 as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
30 tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic
20 lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
Disease, and scleroderma. Moreover, the protein may represent a secreted factor that
35 influences the differentiation or behavior of other blood cells, or that recruits
hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in
the expansion of stem cells and committed progenitors of various blood lineages, and
40 25 in the differentiation and/or proliferation of various cell types. Furthermore, the
protein may also be used to determine biological activity, raise antibodies, as tissue
markers, to isolate cognate ligands or receptors, to identify agents that modulate their
45 interactions, in addition to its use as a nutritional supplement. Protein, as well as,
antibodies directed against the protein may show utility as a tumor marker and/or
30 immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
50 available and accessible through sequence databases. Some of these sequences are

related to SEQ ID NO:77 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 298 of SEQ ID NO:77, b is an integer of 15 to 312, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:77, and where b is greater than or equal to a + 14.

10 FEATURES OF PROTEIN ENCODED BY GENE NO: 68

Contact of cells with supernatant expressing the product of this gene has been shown to increase the permeability of the plasma membrane of THP-1 cells to calcium. Thus it is likely that the product of this gene is involved in a signal transduction pathway that is initiated when the product binds a receptor on the surface of the plasma membrane of both monocytes, in addition to other cell-lines or tissue cell types. Thus, polynucleotides and polypeptides have uses which include, but are not limited to, activating immune and hematopoietic cells and tissue cell types. Binding of a ligand to a receptor is known to alter intracellular levels of small molecules, such as calcium, potassium and sodium, as well as alter pH and membrane potential. Alterations in small molecule concentration can be measured to identify supernatants which bind to receptors of a particular cell.

Moreover, when tested in TF-1 cell lines, the protein product of this gene has been shown to alter the steady-state messenger RNA levels of the following genes: c-fos, c-jun, egr-1, b561, bcl-2, CD40, cyclin D2, GADPH, ICER, MAD3, p21, STAT3, ID3, and STAT-1. When tested in U937 cell lines, the protein product of this gene has been shown to alter the steady-state messenger RNA levels of the following genes: egr2, MKP1, ATF3, B562, cyclin D, cyclin D2, GATA3, MAD3, p21, TGF, DHFR, and JAK3. Based upon these results, it is anticipated that polynucleotides and polypeptides corresponding to this gene are useful as agonists or antagonists of the above referenced genes. Such activity is useful in therapeutic and/or diagnostic applications as referenced and more specifically discussed elsewhere herein.

In specific embodiments, polypeptides of the invention comprise the sequence: MLLEVYGDSISVTVAIPL (SEQ ID NO: 332), MHSPCQSKAADGLGKSETE (SEQ ID NO: 333), and/or MLKSLGLSTN (SEQ ID NO: 334). Polynucleotides encoding these polypeptides are also provided.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: AQRLAEECFYMLLEVYGDSISVTVAIPLMHSPCQSKAADGLGKSETEMLKSLGLSTNMSPFHLLGLKVFTWALTQAICLY FFEVQPLGLLALNFFCTATAGLKELCMHPPSLAFTPEFHTSLSPLAIPSFSGTSLVLSNSHTIPLSLYLPPFSKSRMPDTLHLLVHSLPLVHSQVLPVKDVTIEWPLCQRCLGSTCH Q (SEQ ID NO: 335). Polynucleotides encoding these polypeptides are also provided.

The polypeptide of this gene has been determined to have a transmembrane domain at about amino acid position 11 - 27 of the amino acid sequence referenced in Table 1 for this gene. Moreover, a cytoplasmic tail encompassing amino acids 28 to 143 of this protein has also been determined. Based upon these characteristics, it is believed that the protein product of this gene shares structural features to type Ia membrane proteins.

This gene is expressed primarily in neutrophils and T-cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, disorders and/or diseases affecting the immune system. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues and cell types (e.g., immune, hematopoietic, cells and tissue of the immune system, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene

5 expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

10 Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 191 as residues: Pro-97 to Asp-104. Polynucleotides
5 encoding said polypeptides are also provided.

15 The tissue distribution in neutrophils and T-cells, combined with the detected calcium flux biological activity indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of disorders affecting the immune system. Representative uses are described in the "Immune
20 Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or
25 activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or
15 other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

30 Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such
20 as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
35 such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic
40 25 lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits
45 hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and
30 in the differentiation and/or proliferation of various cell types. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue
50 markers, to isolate cognate ligands or receptors, to identify agents that modulate their

interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:78 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1356 of SEQ ID NO:78, b is an integer of 15 to 1370, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:78, and where b is greater than or equal to a + 14.

15 FEATURES OF PROTEIN ENCODED BY GENE NO: 69

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: WIPRAAGIRHEVQVSLFQMFCFSSIFCSH
EHTHLPCTFWLFLFLFLILPPSCPCFLPFSLAIETVRWPCWHHPTSFELCY
PGTSIYYASRGGPXPNSEX (SEQ ID NO: 336). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in neutrophils.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, diseases and/or disorders affecting the immune system, and neutrophils in particular. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues and cell types (e.g., blood cells,

5 and cells and tissue of the immune system, and cancerous and wounded tissues) or
10 bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another
tissue or cell sample taken from an individual having such a disorder, relative to the
standard gene expression level, i.e., the expression level in healthy tissue or bodily
5 fluid from an individual not having the disorder.

15 The tissue distribution in neutrophils indicates that polynucleotides and
polypeptides corresponding to this gene are useful for the diagnosis and treatment of
disorders affecting the immune system and neutrophils in particular. Representative
uses are described in the "Immune Activity" and "infectious disease" sections below,
20 in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the
expression of this gene product indicates a role in regulating the proliferation;
survival; differentiation; and/or activation of hematopoietic cell lineages, including
blood stem cells. This gene product is involved in the regulation of cytokine
25 production, antigen presentation, or other processes suggesting a usefulness in the
15 treatment of cancer (e.g. by boosting immune responses).

30 Since the gene is expressed in cells of lymphoid origin, the natural gene
product is involved in immune functions. Therefore it is also useful as an agent for
immunological disorders including arthritis, asthma, immunodeficiency diseases such
as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
20 bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
35 such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic
lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
40 25 Disease, and scleroderma. Moreover, the protein may represent a secreted factor that
influences the differentiation or behavior of other blood cells, or that recruits
hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in
the expansion of stem cells and committed progenitors of various blood lineages, and
45 in the differentiation and/or proliferation of various cell types. Furthermore, the
30 protein may also be used to determine biological activity, raise antibodies, as tissue
markers, to isolate cognate ligands or receptors, to identify agents that modulate their
50 interactions, in addition to its use as a nutritional supplement. Protein, as well as,

55

antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:79 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 354 of SEQ ID NO:79, b is an integer of 15 to 368, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:79, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 70

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: XNXXSPLTIGNKSWSSSTAVAAALELVDPPGCRNSARDSPELVHLGKGRPRKLMTYLFCSSISLLLLKVHSSGHQDIRKAKSKVPRLLIIQCPQRE (SEQ ID NO: 337). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in smooth muscle.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, disorders affecting smooth muscle tissue, particularly vascular conditions. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of smooth muscle tissue expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., muscle, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial

fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 193 as residues: Ser-18 to Val-31. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution primarily in smooth muscle indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of disorders affecting smooth muscle tissue. Moreover, the protein is useful in the detection, treatment, and/or prevention of a variety of vascular disorders and conditions, which include, but are not limited to microvascular disease, vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery disease, arteriosclerosis, and/or atherosclerosis. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:80 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1074 of SEQ ID NO:80, b is an integer of 15 to 1088, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:80, and where b is greater than or equal to a + 14.

30 FEATURES OF PROTEIN ENCODED BY GENE NO: 71

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by

the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: GPEENLSPSTPSQMPTIWVKLCLLQVCHGLFP LLKHWSQPMPLCVTLAPVSYWL (SEQ ID NO: 338). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in fetal heart, smooth muscle, and frontal cortex.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, muscular, vascular, or neural diseases and/or disorders, particularly defects or injury to cardiac muscle. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the cardiovascular system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., muscular, vascular, neural, developmental, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, amniotic fluid, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in fetal heart indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosing and treating defects to the heart either due to injury or congenital defects. Moreover, the protein is useful in the detection, treatment, and/or prevention of a variety of vascular disorders and conditions, which include, but are not limited to microvascular disease, vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery disease, arteriosclerosis, and/or atherosclerosis. Alternatively, polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection,

5 treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease,
Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating
10 diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal
cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia,
5 mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder,
learning disabilities, ALS, psychoses, autism, and altered behaviors, including
15 disorders in feeding, sleep patterns, balance, and perception. In addition, elevated
expression of this gene product in regions of the brain indicates it plays a role in
normal neural function. Furthermore, the protein may also be used to determine
20 biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or
receptors, to identify agents that modulate their interactions, in addition to its use as a
nutritional supplement. Protein, as well as, antibodies directed against the protein may
show utility as a tumor marker and/or immunotherapy targets for the above listed
25 tissues.

15 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:81 and may have been publicly available prior to conception of
30 the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is
20 cumbersome. Accordingly, preferably excluded from the present invention are one or
35 more polynucleotides comprising a nucleotide sequence described by the general
formula of a-b, where a is any integer between 1 to 1848 of SEQ ID NO:81, b is an
integer of 15 to 1862, where both a and b correspond to the positions of nucleotide
40 residues shown in SEQ ID NO:81, and where b is greater than or equal to a + 14.

25 FEATURES OF PROTEIN ENCODED BY GENE NO: 72

The translation product of this gene shares sequence homology with adipose
45 complement related protein which is thought to be important in regulating energy
metabolism, insulin levels and fat stores. Moreover, the protein product of this gene
30 has also been shown to have homology to the complement subcomponent C1q A-
chain precursor and HP-25 protein (See Genbank and Geneseq Accession Nos.
50 embiCAA41664.1, dbjIBAA02352.1, and W98013; all references and information

5 available through this accession are hereby incorporated by reference herein). Based
on the sequence similarity, the translation product of this gene is expected to share at
10 least some biological activities with complement proteins.

In another embodiment, polypeptides comprising the amino acid sequence of
5 the open reading frame upstream of the predicted signal peptide are contemplated by
the present invention. Specifically, polypeptides of the invention comprise the
15 following amino acid sequence: PRVRKEPEAMQWLRVRESPGEATGHRVTMG
TAALGPVWAALLLFLLMCEIPMVELTFDRAVASDCQRCCDSEDPLDPAHVSS
ASSSGRPHALPEIRPYINITLKGDKGDPGPMGLPGYMGREGPQGEPGPGQSGK
20 GDKGEMGSFGAPCQKRFFAFSVGRKTALHSGEDFQTLLEFVVFVNLDGC
FDMATGQFAAPLRGIYFFSLNVHSWNYKETYVHIMHNQKEAVILYAQPS
ERSIMQSQSVMLDLAYGDRVWVRLFKRQRENAIYSNDFDTYITFSGHLIKA
25 EDD (SEQ ID NO: 339). Polynucleotides encoding these polypeptides are also
provided.

15 This gene is expressed primarily in placenta and, fetal kidney, and umbilical
vein and to a lesser extent in fetal heart, fetal liver/spleen, microvascular endothelial
cells and cancers of the lung and pharynx.

Therefore, polynucleotides and polypeptides of the invention are useful as
30 reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
35 not limited to, vascular, renal, and reproductive diseases and/or disorders, particularly
cancers of the lung and pharynx. Similarly, polypeptides and antibodies directed to
these polypeptides are useful in providing immunological probes for differential
40 identification of the tissue(s) or cell type(s). For a number of disorders of the above
25 tissues or cells, particularly of the pulmonary and immune systems, expression of this
gene at significantly higher or lower levels is routinely detected in certain tissues or
cell types (e.g., vascular, renal, reproductive, immune, hematopoietic, pulmonary, and
45 cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial
fluid and spinal fluid) or another tissue or cell sample taken from an individual having
30 such a disorder, relative to the standard gene expression level, i.e., the expression
level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 195 as residues: Asp-36 to Asp-48, Ser-57 to His-62, Lys-77 to Gly-84, Met-92 to Gly-114, Gln-203 to Ile-209, Lys-231 to Tyr-239. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in pharynx or lung, combined with the homology to adipose complement related proteins indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosing and treating cancers of the pharynx or lung by modifying the metabolic balance in such tissues. Moreover, the protein is useful in the detection, treatment, and/or prevention of a variety of vascular disorders and conditions, which include, but are not limited to microvascular disease, vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery disease, arteriosclerosis, and/or atherosclerosis. The gene product may also be involved in lymphopoiesis, therefore, it can be used in immune disorders such as infection, inflammation, allergy, immunodeficiency etc. In addition, this gene product may have commercial utility in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:82 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1604 of SEQ ID NO:82, b is an integer of 15 to 1618, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:82, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 73

The translation product of this gene shares sequence homology with a hypothetical 54.7 kD protein (F37A4.1) from *Caenorhabditis elegans* (SwissProt locus YPT1_CAEEL, accession P41879). The protein product of this gene also has homology to the human NG26 which is thought to contain a human major histocompatibility complex class III and is involved in T-cell maturation (See Genbank Accession No. gblAAD18079.11 (AF129756); all references and information available through this accession are hereby incorporated by reference herein; for example, *J. Neurochem.* 69 (6), 2516-2528 (1997)). Based on the sequence similarity, the translation product of this gene is expected to share at least some biological activities with nitric oxide synthase proteins.

Preferred polypeptides of the invention comprise the following amino acid sequence: MLYPGSVYLLQKALMPVLLQGQARLVEECNGRRRAKLLACDGNE IDTMFVDRRGTAEPQGQKL VICCEGNAGFYEVGCVSTPLEAGYSVLGWNHP GFAGSTGVFPFQNEANAMDVVVQFAIHR LGFQPQDIIYAWSIGGFTATWAA MSYPDVSAMILDASFDDL VPLALKVMPDSWRGLVTRTVRQHLN LNNAEQLC RYQGPVLLIRRTKDEIITTTVPEDIMSNRGNDLLL KLLQHRYP RVMAEEGLRV VRQWLEASSQLEEASIYSRWEVEEDWCLSVLSYQAEHGPDFPWSVGEDMS ADGRRQLALFLARKHLHNFEATHCTPLPAQNFQMPWHL (SEQ ID NO: 340).

Polynucleotides encoding such polypeptides are also provided.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: VCPKWCRFLTMLGHCCYFWQVWPASEALAA GPTPSTGSSSPSWKQHIGTSLQKTRGSLPTTTLTSGAGQSTSTGKNPAAGR SLEGALPAGVWPCFAQSPCTGGQQTPT SSTGLRSCLVRSPATWW RTP (SEQ ID NO: 341). Polynucleotides encoding these polypeptides are also provided.

Preferred polypeptides of the invention comprise the following amino acid sequence: WIPRAAGIRHEIYREXDSE RAPASVPETPTAVTAPHSSSWDTYYQ PRALEKHADSILALASVFWSISYSSPFAFFYL YRKGYSLSKVVPFSHYAG TLLLLLAGVACXRGIGRWTPNQYRQFITILEATHRNQSSSENKRQLANYNFD FRSWPVDFHWEPPSSRKESRGGPSRRGVALLRPEPLHRGTADTLLNRVKKL

KTRGSLPTTTLTSGAGQSTSTGKNPAAGRSLEGALPAGVWPCFAQSPCTGG
QQTPSSTGL RSCLVRSPATWW RTP (SEQ ID NO: 343). Polynucleotides
encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome
6. Accordingly, polynucleotides related to this invention are useful as a marker in
linkage analysis for chromosome 6.

This gene is expressed primarily in cerebellum, pituitary, fetal liver, and
primary dendritic cells and to a lesser extent in a wide range of tissues and
developmental stages (i.e. fetal and adult tissue, etc.).

Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, neural, developmental, and immune diseases and/or disorders,
particularly those involving self recognition and T- and B-cell maturation, and cancer.
Similarly, polypeptides and antibodies directed to these polypeptides are useful in
providing immunological probes for differential identification of the tissue(s) or cell
type(s). For a number of disorders of the above tissues or cells, particularly of the
neural or hormonal system, expression of this gene at significantly higher or lower
levels is routinely detected in certain tissues or cell types (e.g., neural, developmental,
immune, hepatic, and cancerous and wounded tissues) or bodily fluids (e.g., serum,

plasma, amniotic fluid, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 196 as residues: Thr-23 to Lys-34, Leu-41 to Ser-47, Ala-57 to Ala-68, Pro-89 to Gly-101, Pro-110 to Pro-117. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in developmental and immune cells, combined with the homology to the human major histocompatibility complex class III region, indicates that polynucleotides and polypeptides corresponding to this gene are useful for treatment and diagnosis of cancer and other proliferative disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and

in the differentiation and/or proliferation of various cell types. Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:83 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2020 of SEQ ID NO:83, b is an integer of 15 to 2034, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:83, and where b is greater than or equal to a + 14.

20 FEATURES OF PROTEIN ENCODED BY GENE NO: 74

The translation product of this gene shares sequence homology with the br-1 protein from the snail nervous system (EMBL HPBR1GENE) which codes for nitric oxide synthetase and which is thought to be important in mediating a variety of cellular responses, including vasodilation. Preferred polypeptides of the invention comprise the following amino acid sequence: MFKRHQRLKKDSTQAEEDLSEQ EQNQLNVLKKHGYVVGRTFLYSEEQKDNIPFEFDADSLAFDMENDPVM GTHKSTKQVELTAQDVKDAHWFYDTPGITKENCILNLLTEKEVNIVLPTQSIV PRFTVLKPGMVLFLGAIGRIDFLQGNQSAWFTVVASNILPVHITSLDRADALY QKHAGHTLLQIPMGGKERMAGFPPLVAEDIMLKEGLGASEAVADIKFSSAG WVSVTPNFKDRLHLRGYTPEGTVLTVRPPLPYIVNIKGQRIKKSVA YKTKKP PSLMYNVRKKKGKINV (SEQ ID NO: 344). Polynucleotides encoding such polypeptides are also provided.

5 A preferred polypeptide fragment of the invention comprises the following
amino acid sequence: MLPARLPFRLLSLFLRGSAPTAARHGLREPLLERRCAA
10 ASSFQHSSSLGREL PYDPVDTEGFGEGGDMQERFLFPEYILDPEPQPTREKQL
QELQQQEEEEERQRQQRREERRQQNLRARSREHPVVGHPDPALPPSGVNCS

LQVSREQYLELVSAALRXPGPSLVLYMVDLLDLPDALLPDLPALVGPQKQLV
15 LGNKVDLLPQDAPGYRQRLRERLWEDCARAGLLAPGTKGHSAPSRTSHR
TGRIRIRTGPAQWSGTCG (SEQ ID NO: 345). Polynucleotides encoding these
polypeptides are also provided.

20 When tested against U937 cell lines, supernatants removed from cells
containing this gene activated the GAS (gamma activating sequence) promoter
element. Thus, it is likely that this gene activates myeloid cells through the JAK-
STAT signal transduction pathway. GAS is a promoter element found upstream of
25 many genes which are involved in the Jak-STAT pathway. The Jak-STAT pathway is
15 a large, signal transduction pathway involved in the differentiation and proliferation
of cells. Therefore, activation of the Jak-STAT pathway, reflected by the binding of
the GAS element, can be used to indicate proteins involved in the proliferation and
30 differentiation of cells.

This gene is expressed primarily in early stage human brain, smooth muscle,
20 and endometrial tumor and to a lesser extent in a variety of tissues representing many
organs and developmental states.

35 Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
40 not limited to, cardiovascular, vascular, and neural diseases and/or disorders,
25 particularly congestive heart disease and neurological disorders. Similarly,
polypeptides and antibodies directed to these polypeptides are useful in providing
immunological probes for differential identification of the tissue(s) or cell type(s). For
45 a number of disorders of the above tissues or cells, particularly of the circulatory and
30 neural systems, expression of this gene at significantly higher or lower levels is
routinely detected in certain tissues or cell types (e.g., cardiovascular, vascular,
50 neural, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma,

urine, amniotic fluid, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 197 as residues: Phe-42 to Leu-48, Pro-53 to Asp-58, Pro-81 to Glu-123, Asp-256 to Trp-269, Gly-282 to Ser-306, Arg-333 to Gly-339, Arg-403 to Gln-425, Ser-446 to Asn-452, His-475 to Gln-480, Gly-592 to Met-597, Pro-635 to His-642, Lys-667 to Lys-672, Lys-678 to Ser-684. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in smooth muscle and vascular tissues, combined with the homology to nitric oxide synthetase indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of congestive heart failure and neurological degenerative disorders. polynucleotides and polypeptides corresponding to this gene are useful for the detection, treatment, and/or prevention of neurodegenerative disease states, behavioral disorders, or inflammatory conditions. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Moreover, the protein is useful in the detection, treatment, and/or prevention of a variety of vascular disorders and conditions, which include, but are not limited to

microvascular disease, vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery disease, arteriosclerosis, and/or atherosclerosis.

Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:84 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2226 of SEQ ID NO:84, b is an integer of 15 to 2240, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:84, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 75

The translation product of this gene shares sequence homology with the human KE04p, in addition to an unidentified C.elegans gene.

The polypeptide of this gene has been determined to have a transmembrane domain at about amino acid position 9 - 25 of the amino acid sequence referenced in Table 1 for this gene. Moreover, a cytoplasmic tail encompassing amino acids 1 to 8 of this protein has also been determined. Based upon these characteristics, it is believed that the protein product of this gene shares structural features to type II membrane proteins.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: PSFRRERVETGGGGPVTHCTEGPFLPLPGGTRM NMTQARVLVAVVGLVAVLLYASIHKIEEGHLAVYYRGGALLTSPSGPGYH

IMLPFITFRSVQTTLQTDEVKNVPCGTSGGVMIYIDRIEVVNMLAPYAVFDIV

5 DAEYAAHKYATSNKHKLTPYLELKKYQAIASNSKIYFGSNIPNMFVDSSC
ALKYSD IRTGRESSLPSKEALEPSGENVIQNKESTG (SEQ ID NO: 346).

Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 10. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 10.

This gene is expressed primarily in fetal tissue, including 8 week whole embryo, fetal liver spleen, nine week old early stage human, fetal heart, fetal liver, fetal lung, and placenta and to a lesser extent in a variety of cancers, and other normal tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, cancer and diseases of fetal development. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the fetal tissues, especially the liver, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., developmental, hepatic, immune, hematopoietic, pulmonary, cardiovascular, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 198 as residues: Leu-68 to Lys-74, Tyr-109 to Lys-115, Gln-200 to Val-205, Lys-207 to Lys-214, Glu-237 to Ile-244, Ala-271 to Thr-

279, Ser-317 to Ser-329, Gln-342 to Gly-348. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution of this gene (primarily fetal tissue and cancerous tissue, both of which are undergoing rapid growth) indicates that polynucleotides and polypeptides corresponding to this gene are useful for treatment and diagnosis of cancer and disorders of fetal development. Moreover, the expression within fetal tissue and other cellular sources marked by proliferating cells indicates this protein may play a role in the regulation of cellular division, and may show utility in the diagnosis, treatment, and/or prevention of developmental diseases and disorders, including cancer, and other proliferative conditions. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as,

antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:85 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1474 of SEQ ID NO:85, b is an integer of 15 to 1488, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:85, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 76

When tested against U937 and Jurkat cell lines, supernatants removed from cells containing this gene activated the GAS (gamma activating sequence) promoter element. Thus, it is likely that this gene activates myeloid and T-cells, and to a lesser extent in other immune cells and tissue cell types, through the JAK-STAT signal transduction pathway. GAS is a promoter element found upstream of many genes which are involved in the Jak-STAT pathway. The Jak-STAT pathway is a large, signal transduction pathway involved in the differentiation and proliferation of cells. Therefore, activation of the Jak-STAT pathway, reflected by the binding of the GAS element, can be used to indicate proteins involved in the proliferation and differentiation of cells.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:86 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 3160 of SEQ ID NO:86, b is an integer of 15 to 3174, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:86, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 77

The translation product of this gene shares sequence homology with protein disulfide isomerase from *Acanthamoeba castellanii* (See Genbank Locus ACADISPROA accession L28174, genpep locus 456013) which is thought to be important in converting proteins into their native conformations. The protein product of this gene was also shown to have homology to a phospholipase C homologue

derived from a mast cell cDNA library (See Geneseq Accession No. R99411). All references and information available through these accessions are hereby incorporated by reference herein - for example, Gene 150 (1), 175-179 (1994).

Included in this invention as preferred domains are endoplasmic reticulum targeting sequence domain and the thioredoxin family active site domain, which were identified using the ProSite analysis tool (Swiss Institute of Bioinformatics). Proteins that permanently reside in the lumen of the endoplasmic reticulum (ER) seem to be distinguished from newly synthesized secretory proteins by the presence of the C-terminal sequence Lys-Asp-Glu-Leu (KDEL) [1,2]. While KDEL is the preferred signal in many species, variants of that signal are used by different species. This situation is described in the following table.

Signal	Species-----
KDEL	Vertebrates, Drosophila, Caenorhabditis elegans, plants
HDEL	Saccharomyces cerevisiae, Kluyveromyces lactis, plants
DDEL	Kluyveromyces lactis
ADEL	Schizosaccharomyces pombe (fission yeast)
SDEL	Plasmodium falciparum

The signal is usually very strictly conserved in major ER proteins but some minor ER proteins have divergent sequences (probably because efficient retention of these proteins is not crucial to the cell). Proteins bearing the KDEL-type signal are not simply held in the ER, but are selectively retrieved from a post-ER compartment by a receptor and returned to their normal location. The consensus pattern is as follows: [KRHQSA]-[DENQ]-E-L-. Thioredoxins are small proteins of approximately one hundred amino- acid residues which participate in various redox reactions via the reversible oxidation of an active center disulfide bond. They exist in either a reduced form or an oxidized form where the two cysteine residues are linked in an intramolecular disulfide bond. Thioredoxin is present in prokaryotes and eukaryotes and the sequence around the redox-active disulfide bond is well conserved. Bacteriophage T4 also encodes for a thioredoxin but its primary structure is not homologous to bacterial, plant and vertebrate thioredoxins. A number of eukaryotic

5 proteins contain domains evolutionary related to thioredoxin, all of them seem to be
protein disulphide isomerases (PDI). PDI (EC 5.3.4.1) is an endoplasmic reticulum
10 enzyme that catalyzes the rearrangement of disulfide bonds in various proteins. The
various forms of PDI which are currently known are: - PDI major isozyme; a
5 multifunctional protein that also function as the beta subunit of prolyl 4-hydroxylase
(EC 1.14.11.2), as a component of oligosaccharyl transferase (EC 2.4.1.119), as
15 thyroxine deiodinase (EC 3.8.1.4), as glutathione-insulin transhydrogenase (EC
1.8.4.2) and as a thyroid hormone-binding protein - ERp60 (ER-60; 58 Kd
microsomal protein). ERp60 was originally thought to be a phosphoinositide-specific
20 phospholipase C isozyme and later to be a protease. - ERp72. - P5. All PDI contains
two or three (ERp72) copies of the thioredoxin domain. The consensus pattern is as
follows: [LIVMF]-[LIVMSTA]-x-[LIVMFYC]-[FYWSTHE]-x(2)-[FYWGNT]-C-
[GATPLVE]-[PHYWSTA]-C-x(6)-[LIVMFYWT]. The two C's form the redox-
25 active bond.

15 Preferred polypeptides of the invention comprise the following amino acid
sequence: SLHRFVLSQAKDEL (SEQ ID NO: 348), FIKFFAPWCGHCKALAPTW
(SEQ ID NO: 349), and/or FIKFYAPWCGHCKTLAPTW (SEQ ID NO: 350).
30 Polynucleotides encoding these polypeptides are also provided.

Further preferred are polypeptides comprising the endoplasmic reticulum
20 targeting sequence domain and thioredoxin family active site domain of the sequence
referenced in Table for this gene, and at least 5, 10, 15, 20, 25, 30, 50, or 75
35 additional contiguous amino acid residues of this referenced sequence. The additional
contiguous amino acid residues is N-terminal or C-terminal to the endoplasmic
reticulum targeting sequence domain and thioredoxin family active site domain.

40 Alternatively, the additional contiguous amino acid residues is both N-terminal and
C-terminal to the endoplasmic reticulum targeting sequence domain and thioredoxin
family active site domain, wherein the total N- and C-terminal contiguous amino acid
45 residues equal the specified number. Based on the sequence similarity, the translation
product of this gene is expected to share at least some biological activities with
30 thioredoxin proteins. Such activities are known in the art, some of which are
described elsewhere herein.

5 In another embodiment, polypeptides comprising the amino acid sequence of
the open reading frame upstream of the predicted signal peptide are contemplated by
the present invention. Specifically, polypeptides of the invention comprise the
10 following amino acid sequence: RRG¹RGVPGPRGRRRLWSAACGHCQRLQPTWN
5 DLGDKYNSMEXAKVYVAKVDCTAHS²DVCSAQGV³RGYP⁴TLKLFKPGQEAV
KYQGPRDFQ⁵TLENWMLQ⁶TLNEEPVTPEPEVEPPSAPELKQGLYELSASNFELH

20 KTLAPTWEELSKKEFFGLAGVKIAEVDCTAERNICKYSVRGYPTLL¹³LFRRGGK
KVSEHSGGRDLDS LHRFVLSQAKDEL (SEQ ID NO: 351). Polynucleotides
encoding these polypeptides are also provided.

25 This gene is expressed primarily in human chondrosarcoma and endothelial
cells and to a lesser extent in a wide range of normal and diseased adult and fetal
15 tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
30 biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, chondrosarcoma and other cancers and proliferative disorders.

20 Similarly, polypeptides and antibodies directed to these polypeptides are useful in
providing immunological probes for differential identification of the tissue(s) or cell
35 type(s). For a number of disorders of the above tissues or cells, particularly of the
immune system, expression of this gene at significantly higher or lower levels is
routinely detected in certain tissues or cell types (e.g., vascular, skeletal,
40 25 developmental, and cancerous and wounded tissues) or bodily fluids (e.g., serum,
plasma, urine, amniotic fluid, synovial fluid and spinal fluid) or another tissue or cell
sample taken from an individual having such a disorder, relative to the standard gene
expression level, i.e., the expression level in healthy tissue or bodily fluid from an
45 individual not having the disorder.

30 The tissue distribution in chondrosarcoma, combined with the homology to
protein disulfide isomerase and phospholipase C indicates that polynucleotides and
50 polypeptides corresponding to this gene are useful for diagnosis and treatment of

chondrosarcoma and other cancers and proliferative disorders, and possibly as a reagent for in vitro production of proteins. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Moreover, the expression in endothelial cells indicates the protein is useful in the detection, treatment, and/or prevention of a variety of vascular disorders and conditions, which include, but are not limited to microvascular disease, vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery disease, arteriosclerosis, and/or atherosclerosis. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are

related to SEQ ID NO:87 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2766 of SEQ ID NO:87, b is an integer of 15 to 2780, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:87, and where b is greater than or equal to a + 14.

10 FEATURES OF PROTEIN ENCODED BY GENE NO: 78

This gene is expressed primarily in thyroid and thymus

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, thyroid diseases including thyroid cancer and diseases of function including Grave's Disease, hyper- and hypo- thyroidism as well as Diseases of the thymus. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the endocrine and immune systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., endocrine, immune, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in thyroid cells and tissues indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of diseases of the thyroid and thymus. Representative uses are described in the "Biological Activity", "Hyperproliferative Disorders", and "Binding Activity" sections below, in Example 11, 17, 18, 19, 20 and 27, and elsewhere herein. Briefly, the protein can be used for the detection, treatment, and/or prevention of

Addison's Disease, Cushing's Syndrome, and disorders and/or cancers of the pancrease (e.g. diabetes mellitus), adrenal cortex, ovaries, pituitary (e.g., hyper-, hypopituitarism), thyroid (e.g. hyper-, hypothyroidism), parathyroid (e.g. hyper-, hypoparathyroidism), hypothalamus, and testes. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:88 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1047 of SEQ ID NO:88, b is an integer of 15 to 1061, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:88, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 79

The translation product of this gene shares sequence homology with collagen which is thought to be important as a structural material in a variety of human tissues and products including hair, nails, muscle and bone.

A preferred polypeptide fragment of the invention comprises the following amino acid sequence: MRPQGAASPQRLRGLLLLLLLQLPAPSSASEIPKGKQK AHSGRGRWWTCIMECAYKGQQECLVETGALGPMAFRVHLGSQVGMDSKEK RGNV (SEQ ID NO: 352). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in smooth muscle and to a lesser extent in 12 week old early stage human, cpdidymus, healing groin wound, synovial hypoxia,

stromal cells, ulcerative colitis, breast and 8 week old embryo, as well as a variety of other normal and diseased cell types from adult and fetal tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, cancer and other proliferative disorders as well as Diseases of smooth muscle. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the muscular system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., vascular, developmental, reproductive, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 202 as residues: Glu-32 to Glu-46, Pro-63 to Ala-71, Pro-81 to Lys-90, Ser-97 to Trp-111, Lys-130 to Ser-135, Leu-147 to Cys-154, Asp-179 to Asn-186, Ser-219 to Gly-229. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in smooth muscle and homology to collagen indicates that polynucleotides and polypeptides corresponding to this gene are useful for treatment and diagnosis of diseases of vascular diseases and/or disorders.

Representative uses are described in the "Biological Activity", "Hyperproliferative Disorders", "infectious disease", and "Regeneration" sections below, in Example 11, 19, and 20, and elsewhere herein. Briefly, the protein is useful in detecting, treating, and/or preventing congenital disorders (i.e. nevi, moles, freckles, Mongolian spots, hemangiomas, port-wine syndrome), integumentary tumors (i.e. keratoses, Bowen's Disease, basal cell carcinoma, squamous cell carcinoma, malignant melanoma, Paget's Disease, mycosis fungoides, and Kaposi's sarcoma), injuries and inflammation of the skin (i.e. wounds, rashes, prickly heat disorder, psoriasis, dermatitis),

atherosclerosis, urticaria, eczema, photosensitivity, autoimmune disorders (i.e. lupus erythematosus, vitiligo, dermatomyositis, morphea, scleroderma, pemphigoid, and pemphigus), keloids, striae, erythema, petechiae, purpura, and xanthelasma. In addition, such disorders may predispose increased susceptibility to viral and bacterial infections of the skin (i.e. cold sores, warts, chickenpox, molluscum contagiosum, herpes zoster, boils, cellulitis, crysipelas, impetigo, tinea, athletes foot, and ringworm).

Moreover, the protein product of this gene may also be useful for the treatment or diagnosis of various connective tissue disorders (i.e., arthritis, trauma, tendonitis, chondromalacia and inflammation, etc.), autoimmune disorders (i.e., rheumatoid arthritis, lupus, scleroderma, dermatomyositis, etc.), dwarfism, spinal deformation, joint abnormalities, and chondrodysplasias (i.e. spondylocipiphyseal dysplasia congenita, familial osteoarthritis, Atelosteogenesis type II, metaphyseal chondrodysplasia type Schmid). Moreover, the protein is useful in the detection, treatment, and/or prevention of a variety of vascular disorders and conditions, which include, but are not limited to microvascular disease, vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery disease, arteriosclerosis, and/or atherosclerosis. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:89 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1328 of SEQ ID NO:89, b is an

integer of 15 to 1342, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:89, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 80

This gene is expressed primarily in immune cells and to a lesser extent in a wide variety of human tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, T cell or B cell leukemia and various immunodeficiencies. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, hematopoietic, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 203 as residues: Gly-3 to Gln-9. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in immune cells indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of immune system diseases such as immunodeficiencies and T cell and/or B cell leukemia. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:90 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 756 of SEQ ID NO:90, b is an integer of 15 to 770, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:90, and where b is greater than or equal to a + 14.

30

50

55

FEATURES OF PROTEIN ENCODED BY GENE NO: 81

The translation product of this gene shares sequence homology with IgE receptor. See for example, Isolation and Characterization of cDNAs coding for the Beta Subunit of the High-affinity Receptor for Immunoglobulin E, Proc. Natl. Acad. Sci. U S A. (1988 Sep.) 85(17): 6483-6487. Based on the sequence similarity, the translation product of this gene is expected to share at least some biological activities with IgE receptor proteins. Such activities are known in the art, some of which are described elsewhere herein. IgE and its receptors are believed to have evolved as a mechanism to protect mammals against parasites. But other and intrinsically innocuous antigens can subvert this system to provoke an allergic response. For human populations in industrialized countries, allergy and asthma now represent a far greater threat than parasitic infection, and the main impetus for current studies of the IgE system is the hope of understanding and intervening in the aetiology of allergic diseases. The high-affinity receptor for immunoglobulin (Ig) E (Fc epsilon RI) on mast cells and basophils plays a key role in IgE-mediated allergies. Fc epsilon RI is composed of one alpha, one beta, and two gamma chains, which are all required for cell surface expression of Fc epsilon RI, but only the alpha chain is involved in the binding to IgE. Fc epsilon RI-IgE interaction is highly species specific, and rodent Fc epsilon RI does not bind human IgE. New homolog can be used to develop anti-allergic agents. FcR deliver signals when they are aggregated at the cell surface. The aggregation of FcR having immunoreceptor tyrosine-based activation motifs (ITAMs) activates sequentially src family tyrosine kinases and syk family tyrosine kinases that connect transduced signals to common activation pathways shared with other receptors. FcR with ITAMs elicit cell activation, endocytosis, and phagocytosis. The nature of responses depends primarily on the cell type. The aggregation of FcR without ITAM does not trigger cell activation. Most of these FcR internalize their ligands, which can be endocytosed, phagocytosed, or transcytosed. The fate of internalized receptor-ligand complexes depends on defined sequences in the intracytoplasmic domain of the receptors. The coaggregation of different FcR results in positive or negative cooperation. Some FcR without ITAM use FcR with ITAM as signal transduction subunits. The coaggregation of antigen receptors or of FcR having ITAMs with FcR having immunoreceptor tyrosine-based inhibition motifs (ITIMs)

negatively regulates cell activation. FcR therefore appear as the subunits of multichain receptors whose constitution is not predetermined and which deliver adaptative messages as a function of the environment.

The polypeptide of this gene has been determined to have four transmembrane domains at about amino acid position 51 - 67, 89 - 105, 119 - 135, and 190 - 206 of the amino acid sequence referenced in Table 1 for this gene. Based upon these characteristics, it is believed that the protein product of this gene shares structural features to type IIIa membrane proteins.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: ETRVKTSLELLRTQLEPTGTVGNTIMTSQPVPN ETIIVLPNSVINFSQAEEKPEPTNQGQDSLKKHLHAEIKVIGTIQILCGMMVLSL GILASASFSPNFTQVTSTLLNSAYFIGPFFFIISGSLSIATEKRLTKLLVHSSLV GSILSALSALVGFIILSVKQATLNPASLQCELDKNNIPTRSYVSYFYHDSLYTT DCYTAKASLAGXLSLMLICTLLEFCLAVLTAVLRWKQAYSDFPGSVLFLPH SYIGNSGMSSKMTHTDCGYEELLTS (SEQ ID NO: 353). Polynucleotides encoding these polypeptides are also provided.

A preferred polypeptide fragment of the invention comprises the following amino acid sequence: MMVLSLGILASASFSPNFTQVTSTLLNSAYFIGPFFFI ISGSLSIATEKRLTKLLVHSSLVGSILSALSALVGFIILSVKQATLNPASLQC ELDKNNIPTRSYVSYFYHDSLYTTDCYTAKASLAGXLSLMLICTLLEFCL AVLTAVLRWKQAYSDFPGSVLFLPHSYIGNSGMSSKMTHTDCGYEELLTS (SEQ ID NO: 354). Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 1. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 1.

This gene is expressed primarily in immune system tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune system diseases and/or disorders such as cancer. Similarly,

polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, hematopoietic, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 204 as residues: Gln-23 to Lys-39, Glu-150 to Thr-158. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in immune cells and tissues combined with the homology to IgE receptor indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of immune system disorders. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that

influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. The gene product may also be involved in lymphopoiesis, therefore, it can be used in immune disorders such as infection, inflammation, allergy, immunodeficiency etc. In addition, this gene product may have commercial utility in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:91 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1556 of SEQ ID NO:91, b is an integer of 15 to 1570, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:91, and where b is greater than or equal to a + 14.

25 FEATURES OF PROTEIN ENCODED BY GENE NO: 82

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: GASCEGGGAAARAALGVHRSQKALLVFRRTL
SNLLYMPLLRGLLWLQVLCAGPLHTEAVVLLVPSDDGRAFLRSRLLHPEAH
VPPAADRGASLQCVLHQAAPKSRPRSPAAGAALLHXPRRTGDEPCREFHGN

GPTQLTPGECGLPAPSSLLQHASAPVRTGSEGQVVGCPRARGETGEGLSLA

FLSSLMFTSRNGLVGC (SEQ ID NO: 355). Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 7. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 7.

This gene is expressed primarily in activated T cells, and to a lesser extent in a wide variety of human tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune and hematopoietic diseases and/or disorders, particularly immunodeficiencies. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, hematopoietic, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 205 as residues: Pro-67 to Ser-73. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in activated T cells indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of immunodeficiencies. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and

elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:92 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general

formula of a-b, where a is any integer between 1 to 2936 of SEQ ID NO:92, b is an integer of 15 to 2950, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:92, and where b is greater than or equal to a + 14.

5 FEATURES OF PROTEIN ENCODED BY GENE NO: 83

The translation product of this gene was shown to have homology to the human transmembrane protein (See Genbank Accession No. gb|AAC51364.1| (AF000959); all references and information available through this accession are hereby incorporated by reference herein; for example, Genomics 42 (2), 245-251 (1997)) which is thought to be implicated in velo-cardio-facial syndrome.

A preferred polypeptide fragment of the invention comprises the following amino acid sequence: MGSAALEILGLVLCLVGWGGILACGLPMWQVTAFLD HNIVTAQTTWKGLWMSCVVQSTGTCSAKCTTRCWL (SEQ ID NO: 356).

Polynucleotides encoding these polypeptides are also provided.

The gene encoding the disclosed cDNA is believed to reside on chromosome 22. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 22.

This gene is expressed primarily in dementia brain tissue, and to a lesser extent in a wide variety of human tissues.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, neural diseases and/or disorders, particularly dementia. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the central nervous system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 206 as residues: Ser-201 to Tyr-217. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in dementia brain tissue, combined with the homology to the transmembrane protein indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of dementia, and potentially for velo-cardio-facial syndrome. Representative uses are described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not limited to the detection, treatment, and/or prevention of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis, encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma, congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms, hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism, and altered behaviors, including disorders in feeding, sleep patterns, balance, and perception. In addition, elevated expression of this gene product in regions of the brain indicates it plays a role in normal neural function.

Potentially, this gene product is involved in synapse formation, neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or survival. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:93 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general

formula of a-b, where a is any integer between 1 to 1708 of SEQ ID NO:93, b is an integer of 15 to 1722, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:93, and where b is greater than or equal to a + 14.

5 FEATURES OF PROTEIN ENCODED BY GENE NO: 84

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: LKRAPPGPALAKGLLQPSSTFQALETNIGDQVR
RHSTAVVIREMTSYTLISFVLLIGVGCIEKDQSCPVFGGRKRLHLLFVGGQLRQ
VRMLRGELSCACYRPHVQALQLGGCTCF (SEQ ID NO: 357). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in the adult pulmonary system.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, cystic fibrosis, bronchitis and any pulmonary disorders in general. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the pulmonary system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., pulmonary, cardiovascular, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, pulmonary surfactant, pulmonary lavage/sputum, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution of this gene only in the pulmonary system indicates that it plays a key role in the functioning of the pulmonary system. This would suggest that misregulation of the expression of this protein product in the adult could lead to lymphoma or sarcoma formation, particularly in the lung and the protein product could be used either in the treatment and/or detection of these disease states. The gene

or gene product may also be useful in the treatment and/or detection of pulmonary defects such as pulmonary edema and embolism, bronchitis and cystic fibrosis. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:94 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 621 of SEQ ID NO:94, b is an integer of 15 to 635, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:94, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 85

The translation product of this gene was found to be homologous to CAM proteins. Based on the sequence similarity, the translation product of this gene is expected to share at least some biological activities with CAM proteins. Such activities are known in the art, some of which are described elsewhere herein.

A preferred polypeptide variant of the invention comprises the following amino acid sequence: MLCPWRTANLGLLLILTIFLVAEAGAAQPNNSLM LQTSKENHALASSSLCMDEKQITQNYSKVLAENVTSWPVKMATNAVLC CPPIALRNLIITWEIILRGQPSCTKAYKKETNETKETNCTDERITWVSRPDQ NSDLQIRTVAITHDGYRCIMVTPDGNFHRGYHLQVLVTPEVTLFQNRNRTA VCKAVAGKPAAHISWIPEGDCATKQEYWSNGTVTVKSTCHWEVHNVSTV NCHVSHLTGNKSLYIELLPVPGAKKSSKLYIPYIILTIILTIIVGXIWLLKVNQ CXKYKLNKPESTPVVEEDEMOPYAFYTEKNNPLXXTTNKVKASEALQSEV

DTDLHTL (SEQ ID NO:208). Polynucleotides encoding these polypeptides are also provided.

The polypeptide of this gene has been determined to have a transmembrane domain at about amino acid position 271 - 287 of the amino acid sequence referenced in Table 1 for this gene. Moreover, a cytoplasmic tail encompassing amino acids 288 to 348 of this protein has also been determined. Based upon these characteristics, it is believed that the protein product of this gene shares structural features to type Ia membrane proteins.

This gene is expressed primarily in dendritic cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immunodeficiency, tumor necrosis, infection, lymphomas, auto-immunities, cancer, metastasis, wound healing, inflammation, anemias (leukemia) and other hematopoietic disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, hematopoietic, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 208 as residues: Asp-53 to Tyr-61, Pro-105 to Ile-128, Arg-133 to Leu-140, Gln-182 to Ala-188, Pro-205 to Asn-218, Gly-259 to Ala-264, Asn-290 to Ser-302, Glu-307 to Tyr-314, Tyr-317 to Lys-332. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in dendritic cells indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of immune disorders including: leukemias, lymphomas, auto-immunities,

immunodeficiencies (e.g. AIDS), immuno-suppressive conditions (transplantation) and hematopoietic disorders. In addition this gene product is applicable in conditions of general microbial infection, inflammation or cancer. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. Furthermore, the protein may also be used to determine biological activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:95 and may have been publicly available prior to conception of

the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 3784 of SEQ ID NO:95, b is an integer of 15 to 3798, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:95, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 86

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: VIKLICPAAFPVYFQDMARGCVCSLCASVCIFLS SLFPLLPSVHSVNIISCLLLSKCFEGLELMCEHL YQLSQLHVLHHIFSYLLCTP (SEQ ID NO: 358). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in embryonic tissue and to a lesser extent in a variety of other tissues and cell types.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, developmental anomalies, fetal deficiencies, cancer and neoplastic states. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the developing fetus, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., developmental, differentiating, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, amniotic fluid, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in embryonic tissue indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and treatment of developmental anomalies, fetal deficiencies and pre-natal disorders, as well as abnormal cell proliferation and/or differentiation, neoplastic states and cancer.

Moreover, the expression within embryonic tissue and other cellular sources marked by proliferating cells indicates this protein may play a role in the regulation of cellular division, and may show utility in the diagnosis, treatment, and/or prevention of developmental diseases and disorders, including cancer, and other proliferative conditions. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

5 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
10 related to SEQ ID NO:96 and may have been publicly available prior to conception of
the present invention. Preferably, such related polynucleotides are specifically
5 excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
15 more polynucleotides comprising a nucleotide sequence described by the general
formula of a-b, where a is any integer between 1 to 2669 of SEQ ID NO:96, b is an
integer of 15 to 2683, where both a and b correspond to the positions of nucleotide
20 residues shown in SEQ ID NO:96, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 87

25 The translation product of this gene shares sequence homology with inter-
alpha-trypsin inhibitor which is thought to be important in inhibition of trypsin and
15 other serine proteases (See Genbank Accession No. pirlS30350/S30350; all references
and information available through this accession are hereby incorporated herein by
reference; for example, Eur. J. Biochem. 179 (1), 147-154 (1989), J. Biol. Chem. 264
30 (27), 15975-15981 (1989), and J. Biol. Chem. 266 (2), 747-751 (1991)).

20 Contact of cells with supernatant expressing the product of this gene has been
shown to increase the permeability of the plasma membrane of THP-1 cells to
35 calcium. Thus it is likely that the product of this gene is involved in a signal
transduction pathway that is initiated when the product binds a receptor on the surface
of the plasma membrane of both monocytes, in addition to other cell-lines or tissue
40 cell types. Thus, polynucleotides and polypeptides have uses which include, but are
25 not limited to, activating monocytes, and to a lesser extent, other immune and/or
hematopoietic cells. Binding of a ligand to a receptor is known to alter intracellular
levels of small molecules, such as calcium, potassium and sodium, as well as alter pH
45 and membrane potential. Alterations in small molecule concentration can be measured
to identify supernatants which bind to receptors of a particular cell.

30 In another embodiment, polypeptides comprising the amino acid sequence of
the open reading frame upstream of the predicted signal peptide are contemplated by
50 the present invention. Specifically, polypeptides of the invention comprise the

following amino acid sequence: YXIPGSTHASGRQRGSGRGEDDSGPPSTVINQ

(SEQ ID NO: 359). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in placenta and adipose tissue and to a lesser extent in several other organs and tissues including cancer.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, disorders of developing organs and metabolic diseases, in addition to vascular diseases and conditions. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the developing systems and metabolic systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., reproductive, vascular, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

5 Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 210 as residues: Lys-5 to Lys-10, Asn-33 to Lys-39,
10 Asp-48 to Lys-54, Pro-62 to Asp-67, Asn-116 to Arg-123, His-157 to Ala-162, Val-
242 to Lys-249, Val-251 to Asp-264. Polynucleotides encoding said polypeptides are
5 also provided.

15 The tissue distribution in placenta, combined with the homology to inter-
alpha-trypsin inhibitor and the detected calcium flux biological activity indicates that
polynucleotides and polypeptides corresponding to this gene are useful for treatment
and diagnosis of disorders of developing and metabolic systems. This protein may
20 play a role in the regulation of cellular division, and may show utility in the diagnosis,
treatment, and/or prevention of developmental diseases and disorders, including
cancer, and other proliferative conditions. Representative uses are described in the
"Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere
25 herein. Briefly, developmental tissues rely on decisions involving cell differentiation
and/or apoptosis in pattern formation.
15

Dysregulation of apoptosis can result in inappropriate suppression of cell
30 death, as occurs in the development of some cancers, or in failure to control the extent
of cell death, as is believed to occur in acquired immunodeficiency and certain
neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of
20 potential roles in proliferation and differentiation, this gene product may have
applications in the adult for tissue regeneration and the treatment of cancers. It may
35 also act as a morphogen to control cell and tissue type specification. Therefore, the
polynucleotides and polypeptides of the present invention are useful in treating,
detecting, and/or preventing said disorders and conditions, in addition to other types
40 of degenerative conditions. Thus this protein may modulate apoptosis or tissue
25 differentiation and is useful in the detection, treatment, and/or prevention of
degenerative or proliferative conditions and diseases. The protein is useful in
modulating the immune response to aberrant polypeptides, as may exist in
45 proliferating and cancerous cells and tissues. The protein can also be used to gain new
30 insight into the regulation of cellular growth and proliferation. Moreover, the protein
is useful in the detection, treatment, and/or prevention of a variety of vascular
50 disorders and conditions, which include, but are not limited to microvascular disease,

vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery disease, arteriosclerosis, and/or atherosclerosis. Polynucleotides and polypeptides of the invention are also useful for the treatment, detection, and/or prevention of inflammation, tumor invasion and metastasis, wound healing, liver disease, disseminated intravascular coagulation, alzheimer's Disease, ophthalmic disease, apoptosis, tissue remodeling, intrauterine growth retardation, preeclampsia, angiogenesis, cell migration, fetal development, trophoblast implantation, ovulation, pemphigus and psoriasis, and antiviral therapy. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:97 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 2167 of SEQ ID NO:97, b is an integer of 15 to 2181, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:97, and where b is greater than or equal to a + 14.

25 FEATURES OF PROTEIN ENCODED BY GENE NO: 88

The translation product of this gene was shown to have homology to the human colon carcinoma antigen NY-CO-7 (See Genbank and Gcneseq Accession Nos. gb|AAC18038.1| (AF039689) and WO9904265; all references available through this accession are hereby incorporated herein by reference; for example, Int. J. Cancer 76 (5), 652-658 (1998)).

This gene is expressed primarily in breast and breast cancer and to a lesser extent in several other organs and tissues including cancers.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, disorders of reproductive organs and the gastrointestinal system, including cancers. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the reproductive systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., gastrointestinal, reproductive, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, breast milk, chyme, bile, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 211 as residues: Gly-22 to Gly-28, Leu-71 to Phe-77, Asn-101 to Val-108, Pro-122 to Ser-127, Arg-149 to Pro-154, Gly-191 to Phe-196, Pro-199 to Thr-211. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in breast and breast cancer tissue, combined with the homology to a colon cancer antigen indicates that polynucleotides and polypeptides corresponding to this gene are useful for treatment and diagnosis of disorders of the reproductive systems and cancers. This protein may play a role in the regulation of cellular division, and may show utility in the diagnosis, treatment, and/or prevention of developmental diseases and disorders, including cancer, and other proliferative conditions. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of

potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:98 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1943 of SEQ ID NO:98, b is an integer of 15 to 1957, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:98, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 89

The translation product of this gene shares sequence homology with the amino acid and protein sequence of a *Xenopus* transmembrane protein of unknown function. The very 5'-end of the contig is identical to the mRNA for the human LGN mosaic protein. Based on the sequence similarity, the translation product of this gene is

5

expected to share at least some biological activities with LGN mosaic proteins. Such activities are known in the art, some of which are described elsewhere herein.

10

Preferred polypeptides of the invention comprise the following amino acid sequence:

PRVRPPTKALAVTFTTFVTEPLKHIGKGTGEFIKALMKEIPALLHLPVLIIMAL
5 AILSFCYGAGKSVHVL RHIGGPEREPPQALRPDRRRQEEIDYRPDGGAGDAD
FHYRGQMGPTEQGPYAKTYEGRREILRERDVDLRFQTGNKSPEVLRAFDVPD
15 AEAREHPTVVPSHKSPVLDTKPKETGGILGEGTPKESSTESSQSAKPVSGQDTS
GNTEGSPA AEKAQLKSEAAGSPDQGSTYSPARGVAGPRGQDPVSSPCG (SEQ
ID NO:339). Polynucleotides encoding such polypeptides are also provided.

20

10 The gene encoding the disclosed cDNA is believed to reside on chromosome 1. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 1.

25

15 This gene is expressed primarily in small intestine and adipocytes and to a lesser extent in various other normal and transformed cell types, mostly of endocrine origin.

30

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, conditions of growth and metabolism. Similarly, polypeptides and
20 antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the digestive and endocrine systems, expression of this gene at significantly higher or lower levels is routinely
35 detected in certain tissues or cell types (e.g., metabolic, gastrointestinal, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, bile, chyme, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e.,
40 the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

45

30 Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 212 as residues: Pro-40 to Gly-68, Gly-79 to Arg-93, Phe-106 to Glu-114, Pro-122 to His-129, Thr-143 to Gly-149, Gly-155 to Ala-168,
50

55

Val-171 to Gly-182, Ala-195 to Pro-207, Pro-214 to Val-220. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in small intestine indicates that polynucleotides and polypeptides corresponding to this gene are useful for study and treatment of disorders of growth and metabolism as well as endocrine abnormalities. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:99 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1098 of SEQ ID NO:99, b is an integer of 15 to 1112, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:99, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 90

The translation product of this gene shares sequence homology with IgE receptor beta chain which is thought to be important in immune function.

This gene is expressed primarily in kidney medulla tissue.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune and renal diseases and/or disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune and renal systems,

5
10
15

50
55

expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, renal, urogenital, and cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

The tissue distribution in kidney renal medulla tissue, combined with the homology to the IgE receptor beta chain indicates that polynucleotides and polypeptides corresponding to this gene are useful for the treatment of immune and renal disorders. The protein product of this gene could be used in the treatment and/or detection of kidney diseases including renal failure, nephritis, renal tubular acidosis, proteinuria, pyuria, edema, pyelonephritis, hydronephritis, nephrotic syndrome, crush syndrome, glomerulonephritis, hematuria, renal colic and kidney stones, in addition to Wilm's Tumor Disease, and congenital kidney abnormalities such as horseshoe kidney, polycystic kidney, and Falconi's syndrome. Alternatively, this gene product is involved in the regulation of cytokine production, antigen presentation, or other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene product is involved in immune functions. Therefore it is also useful as an agent for immunological disorders including arthritis, asthma, immunodeficiency diseases such as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities, such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's Disease, and scleroderma. Moreover, the protein may represent a secreted factor that influences the differentiation or behavior of other blood cells, or that recruits hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in the expansion of stem cells and committed progenitors of various blood lineages, and in the differentiation and/or proliferation of various cell types. Furthermore, the

protein may also be used to determine biological activity, raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO: 100 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 873 of SEQ ID NO:100, b is an integer of 15 to 887, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:100, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 91

The translation product of this gene shares sequence homology with Diff 40 gene product (See Genbank Accession No. gb|AAC51134.1; all references and information available through this reference are hereby incorporated herein).

Preferred polypeptides of the invention comprise the following amino acid sequence: PRVRSIKVTELKGLANHVVVGSVSCETKDLFAALPQVVAVDIN

PSSGPLDEEGAVAPVLANGHAPYSRTLSHISEASVNAALAEASVEAVGPKSL
SWGSPPTHPAPTHGKHPSVPPALDPGHSATSSTLGTTGSVPTSTD (SEQ ID
NO: 361). Polynucleotides encoding these polypeptides are also provided.

Polypeptides of the invention do not consist of the primary amino acid sequence
shown as Geneseq Accession No. W69430, which is hereby incorporated herein by
reference.

This gene is expressed primarily in liver and to a lesser extent in gall bladder
tissue.

Therefore, polynucleotides and polypeptides of the invention are useful as
reagents for differential identification of the tissue(s) or cell type(s) present in a
biological sample and for diagnosis of diseases and conditions which include, but are
not limited to, metabolic and endocrine diseases and/or disorders, particularly hepatic
and gall bladder disorders. Similarly, polypeptides and antibodies directed to these
polypeptides are useful in providing immunological probes for differential
identification of the tissue(s) or cell type(s). For a number of disorders of the above
tissues or cells, particularly of the metabolic and endocrine systems, expression of this
gene at significantly higher or lower levels is routinely detected in certain tissues or
cell types (e.g., hepatic, metabolic, gall bladder, gastrointestinal, and cancerous and
wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, bile, synovial
fluid and spinal fluid) or another tissue or cell sample taken from an individual having
such a disorder, relative to the standard gene expression level, i.e., the expression
level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic
epitopes shown in SEQ ID NO: 214 as residues: Val-9 to Cys-14, Pro-42 to Thr-47,
Thr-56 to Ala-64, Asp-88 to His-98, Cys-128 to Ser-136, Arg-153 to Trp-161.
Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in liver and gall bladder, combined with the homology
to the diff 40 gene product indicates that polynucleotides and polypeptides
corresponding to this gene are useful for the study and treatment of endocrine and
metabolic disorders. polynucleotides and polypeptides corresponding to this gene are
useful for the detection and treatment of liver disorders and cancers. Representative
uses are described in the "Hyperproliferative Disorders", "infectious disease", and

"Binding Activity" sections below, in Example 11, and 27, and elsewhere herein. Briefly, the protein can be used for the detection, treatment, and/or prevention of hepatoblastoma, jaundice, hepatitis, liver metabolic diseases and conditions that are attributable to the differentiation of hepatocyte progenitor cells. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:101 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1234 of SEQ ID NO:101, b is an integer of 15 to 1248, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:101, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 92

The polypeptide of this gene has been determined to have a transmembrane domain at about amino acid position 3 - 19 of the amino acid sequence referenced in Table 1 for this gene. Based upon these characteristics, it is believed that the protein product of this gene shares structural features to type II membrane proteins.

This gene is expressed primarily in fetal brain and to a lesser extent in pancreas tumor, melanocyte and infant brain.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, neural diseases and/or disorders, particularly neurodevelopmental disorders. Similarly, polypeptides and antibodies directed to these polypeptides are

5 useful in providing immunological probes for differential identification of the
tissue(s) or cell type(s). For a number of disorders of the above tissues or cells,
10 particularly of the central nervous system, expression of this gene at significantly
higher or lower levels is routinely detected in certain tissues or cell types (e.g., neural,
5 developmental, and cancerous and wounded tissues) or bodily fluids (e.g., lymph,
serum, plasma, amniotic fluid, urine, synovial fluid and spinal fluid) or another tissue
15 or cell sample taken from an individual having such a disorder, relative to the
standard gene expression level, i.e., the expression level in healthy tissue or bodily
fluid from an individual not having the disorder.

20 10 The tissue distribution in fetal brain tissue indicates that polynucleotides and
polypeptides corresponding to this gene are useful for diagnosis and treatment of
developmental disorders of the central nervous system. Representative uses are
described in the "Regeneration" and "Hyperproliferative Disorders" sections below, in
25 Example 11, 15, and 18, and elsewhere herein. Briefly, the uses include, but are not
15 limited to the detection, treatment, and/or prevention of Alzheimer's Disease,
Parkinson's Disease, Huntington's Disease, Tourette Syndrome, meningitis,
encephalitis, demyelinating diseases, peripheral neuropathies, neoplasia, trauma,
30 congenital malformations, spinal cord injuries, ischemia and infarction, aneurysms,
hemorrhages, schizophrenia, mania, dementia, paranoia, obsessive compulsive
20 disorder, depression, panic disorder, learning disabilities, ALS, psychoses, autism,
and altered behaviors, including disorders in feeding, sleep patterns, balance, and
35 perception. In addition, elevated expression of this gene product in regions of the
brain indicates it plays a role in normal neural function.

40 25 Potentially, this gene product is involved in synapse formation,
neurotransmission, learning, cognition, homeostasis, or neuronal differentiation or
survival. Furthermore, the protein may also be used to determine biological activity,
to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to
45 identify agents that modulate their interactions, in addition to its use as a nutritional
supplement. Protein, as well as, antibodies directed against the protein may show
30 utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

50 Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are

55

related to SEQ ID NO:102 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1827 of SEQ ID NO:102, b is an integer of 15 to 1841, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:102, and where b is greater than or equal to a + 14.

10 FEATURES OF PROTEIN ENCODED BY GENE NO: 93

The translation product of this gene shares sequence homology with a probable membrane protein YGL054c -yeast (*Saccharomyces cerevisiae*). Moreover,

The translation product of this gene also have homology to the human and mouse cornichon protein which is known to be necessary for both anterior-posterior and dorsal-ventral pattern formation in conjunction with the EGF receptor signaling process (See Genbank Accession Nos. gblAAC98388.11 (AF104398), and splP52159; all references and information available through these accessions are hereby incorporated herein by reference; for example, Cell 81 (6), 967-978 (1995)).

The polypeptide of this gene has been determined to have two transmembrane domains at about amino acid position 57 - 73, and 121 - 137 of the amino acid sequence referenced in Table 1 for this gene. Moreover, a cytoplasmic tail encompassing amino acids 1 - 14 of this protein has also been determined. Based upon these characteristics, it is believed that the protein product of this gene shares structural features to type IIIa membrane proteins.

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: YGCEKTTEGRRRRRRMEAVVFVFSLLDCCALIFLSVYFIITLSDLECDYINARSCCSKLNKWWIPELIGHTIVTVLLLSLHWFIFLLNLPVATWNIYRYIMVPSGNMGVFDPTTEIHNRGQLKSHMKEAMIKLGFHLLCFFMYLYSMILALIND (SEQ ID NO:362). Polynucleotides encoding these polypeptides are also provided.

5

10

The gene encoding the disclosed cDNA is believed to reside on chromosome 1. Accordingly, polynucleotides related to this invention are useful as a marker in linkage analysis for chromosome 1.

15

This gene is expressed primarily in activated T-cells and to a lesser extent in endometrial tumor, T cell helper II cells, microvascular endothelial cells, Raji cells treated with cyclohexamide and umbilical vein endothelial cells.

20

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune, hematopoietic, and vascular diseases and/or disorders.

25

Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, hematopoietic, vascular, and cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, amniotic fluid, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

35

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 216 as residues: Ser-39 to Asn-45, Asn-103 to Ser-109. Polynucleotides encoding said polypeptides are also provided.

40

The tissue distribution in activated T-cells indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of immune disorders involving activated T-cells. Representative uses are described in the "Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14, 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene product indicates a role in regulating the proliferation; survival; differentiation; and/or activation of hematopoietic cell lineages, including blood stem cells. This gene product is involved in the regulation of cytokine production, antigen presentation, or

45

30

50

55

5 other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting
immune responses).

10 Since the gene is expressed in cells of lymphoid origin, the natural gene
product is involved in immune functions. Therefore it is also useful as an agent for
5 immunological disorders including arthritis, asthma, immunodeficiency diseases such
as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
15 bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
20 disorders, such as autoimmune infertility, lens tissue injury, demyelination, systemic
lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
Disease, and scleroderma. Moreover, the protein may represent a secreted factor that
influences the differentiation or behavior of other blood cells, or that recruits
25 hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in
15 the expansion of stem cells and committed progenitors of various blood lineages, and
in the differentiation and/or proliferation of various cell types. Moreover, the protein
is useful in the detection, treatment, and/or prevention of a variety of vascular
30 disorders and conditions, which include, but are not limited to microvascular disease,
vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery
20 disease, arteriosclerosis, and/or atherosclerosis. Furthermore, the protein may also be
used to determine biological activity, to raise antibodies, as tissue markers, to isolate
35 cognate ligands or receptors, to identify agents that modulate their interactions, in
addition to its use as a nutritional supplement. Protein, as well as, antibodies directed
40 against the protein may show utility as a tumor marker and/or immunotherapy targets
25 for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
available and accessible through sequence databases. Some of these sequences are
45 related to SEQ ID NO:103 and may have been publicly available prior to conception
of the present invention. Preferably, such related polynucleotides are specifically
30 excluded from the scope of the present invention. To list every related sequence is
cumbersome. Accordingly, preferably excluded from the present invention are one or
50 more polynucleotides comprising a nucleotide sequence described by the general

formula of a-b, where a is any integer between 1 to 671 of SEQ ID NO:103, b is an integer of 15 to 685, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:103, and where b is greater than or equal to a + 14.

5 FEATURES OF PROTEIN ENCODED BY GENE NO: 94

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: ARAPAPSLPPLPSPAPALAPAHSLGLLLGRMS
GSSLPSALALSLLLVS²GSLLPGPGAAQNVVRVQSGQDQ (SEQ ID NO: 363).
Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in dendritic cells and to a lesser extent in healing abdomen wound, and pancreas islet cell tumor cells.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune and hematopoietic diseases and/or disorders, particularly wound healing disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., immune, hematopoietic, and cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 217 as residues: Gln-34 to Lys-40. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in dendritic cells and early healing wound indicates that polynucleotides and polypeptides corresponding to this gene are useful for treating

5 wounds to enhance the healing process. Representative uses are described in the
"Immune Activity" and "infectious disease" sections below, in Example 11, 13, 14,
10 16, 18, 19, 20, and 27, and elsewhere herein. Briefly, the expression of this gene
product indicates a role in regulating the proliferation; survival; differentiation; and/or
5 activation of hematopoietic cell lineages, including blood stem cells. This gene
product is involved in the regulation of cytokine production, antigen presentation, or
15 other processes suggesting a usefulness in the treatment of cancer (e.g. by boosting
immune responses).

Since the gene is expressed in cells of lymphoid origin, the natural gene
20 product is involved in immune functions. Therefore it is also useful as an agent for
immunological disorders including arthritis, asthma, immunodeficiency diseases such
as AIDS, leukemia, rheumatoid arthritis, granulomatous Disease, inflammatory
bowel disease, sepsis, acne, neutropenia, neutrophilia, psoriasis, hypersensitivities,
25 such as T-cell mediated cytotoxicity; immune reactions to transplanted organs and
tissues, such as host-versus-graft and graft-versus-host diseases, or autoimmunity
15 disorders, such as autoimmune infertility, lense tissue injury, demyelination, systemic
lupus erythematosus, drug induced hemolytic anemia, rheumatoid arthritis, Sjogren's
Disease, and scleroderma. Moreover, the protein may represent a secreted factor that
30 influences the differentiation or behavior of other blood cells, or that recruits
hematopoietic cells to sites of injury. Thus, this gene product is thought to be useful in
20 the expansion of stem cells and committed progenitors of various blood lineages, and
in the differentiation and/or proliferation of various cell types. Furthermore, the
protein may also be used to determine biological activity, raise antibodies, as tissue
35 markers, to isolate cognate ligands or receptors, to identify agents that modulate their
interactions, in addition to its use as a nutritional supplement. Protein, as well as,
40 antibodies directed against the protein may show utility as a tumor marker and/or
immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly
45 available and accessible through sequence databases. Some of these sequences are
related to SEQ ID NO:104 and may have been publicly available prior to conception
30 of the present invention. Preferably, such related polynucleotides are specifically
excluded from the scope of the present invention. To list every related sequence is

Contact of cells with supernatant expressing the product of this gene has been shown to increase the permeability of the plasma membrane of aortic smooth muscle cells to calcium. Thus it is likely that the product of this gene is involved in a signal transduction pathway that is initiated when the product binds a receptor on the surface of the plasma membrane of both smooth muscle cells, and in other cell-lines or tissue cell types. Thus, polynucleotides and polypeptides have uses which include, but are not limited to, activating smooth muscle cells. Binding of a ligand to a receptor is known to alter intracellular levels of small molecules, such as calcium, potassium and sodium, as well as alter pH and membrane potential. Alterations in small molecule concentration can be measured to identify supernatants which bind to receptors of a particular cell.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, metabolic and immune diseases and/or disorders, particularly cancers, such as pancreatic carcinoma and gall bladder tumor. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., metabolic, immune, hematopoietic, and cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such

5 a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

10 Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 218 as residues: Lys-34 to Ile-41. Polynucleotides
5 encoding said polypeptides are also provided.

15 The tissue distribution in pancreatic carcinoma and gall bladder indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosing and treating cancer, such as pancreatic carcinoma and gall bladder tumors.

20 Representative uses are described here and elsewhere herein. Alternatively, the detected calcium flux biological activity indicates the protein is useful in the detection, treatment, and/or prevention of a variety of vascular disorders and conditions, which include, but are not limited to microvascular disease, vascular leak syndrome, aneurysm, stroke, embolism, thrombosis, coronary artery disease,
25 arteriosclerosis, and/or atherosclerosis. Furthermore, the protein may also be used to
15 determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the
30 protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

20 Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are
35 related to SEQ ID NO: 105 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is
40 25 cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1161 of SEQ ID NO: 105, b is an
45 integer of 15 to 1175, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO: 105, and where b is greater than or equal to a + 14.
30

5

FEATURES OF PROTEIN ENCODED BY GENE NO: 96

10

The polypeptide of this gene has been determined to have a transmembrane domain at about amino acid position 10 - 26 of the amino acid sequence referenced in Table 1 for this gene. Moreover, a cytoplasmic tail encompassing amino acids 27 to 48 of this protein has also been determined. Based upon these characteristics, it is believed that the protein product of this gene shares structural features to type Ib membrane proteins.

15

This gene is expressed primarily in osteosarcoma, wilm's tumor, ovarian cancer and in T-cells.

20

10

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, inflammatory diseases and cancers, such as osteosarcoma, wilm's tumor and ovarian cancer. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., skeletal, renal, reproductive, immune, and cancerous and wounded tissues) or bodily fluids (e.g., lymph, serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

25

15

30

35

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 219 as residues: Ser-30 to Pro-35. Polynucleotides encoding said polypeptides are also provided.

40

25

45

The tissue distribution indicates that polynucleotides and polypeptides corresponding to this gene are useful for diagnosis and treatment of inflammatory conditions and cancer, such as osteosarcoma, wilm's tumor and ovarian cancer. Moreover, the expression within cellular sources marked by proliferating cells indicates this protein may play a role in the regulation of cellular division, and may show utility in the diagnosis, treatment, and/or prevention of developmental diseases

50

55

5
10 and disorders, including cancer, and other proliferative conditions. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

5 Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain
15 neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may
20 also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue
25 differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new
30 insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their
35 interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

40 Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:106 and may have been publicly available prior to conception
45 of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or
30 more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1007 of SEQ ID NO:106, b is an
50

integer of 15 to 1021, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO: 106, and where b is greater than or equal to a + 14.

FEATURES OF PROTEIN ENCODED BY GENE NO: 97

In another embodiment, polypeptides comprising the amino acid sequence of the open reading frame upstream of the predicted signal peptide are contemplated by the present invention. Specifically, polypeptides of the invention comprise the following amino acid sequence: GTSKDCVLYAFLDPGMAVPLFLYIFTLLPLLPLFLLSLCFSPLTVKRSSSES⁹⁷KSSL (SEQ ID NO: 364). Polynucleotides encoding these polypeptides are also provided.

This gene is expressed primarily in ovarian cancer.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, ovarian cancer. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune system, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., reproductive, ovarian, and cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial amniotic fluid, fluid or spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 220 as residues: Thr-28 to Ser-40. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution in ovarian tissues indicates that polynucleotides and polypeptides corresponding to this gene are useful for treating and diagnosing cancer, e.g., ovarian cancer. Moreover, the expression within cellular sources marked by proliferating cells indicates this protein may play a role in the regulation of cellular division, and may show utility in the diagnosis, treatment, and/or prevention of

developmental diseases and disorders, including cancer, and other proliferative conditions. Representative uses are described in the "Hyperproliferative Disorders" and "Regeneration" sections below and elsewhere herein. Briefly, developmental tissues rely on decisions involving cell differentiation and/or apoptosis in pattern formation.

Dysregulation of apoptosis can result in inappropriate suppression of cell death, as occurs in the development of some cancers, or in failure to control the extent of cell death, as is believed to occur in acquired immunodeficiency and certain neurodegenerative disorders, such as spinal muscular atrophy (SMA). Because of potential roles in proliferation and differentiation, this gene product may have applications in the adult for tissue regeneration and the treatment of cancers. It may also act as a morphogen to control cell and tissue type specification. Therefore, the polynucleotides and polypeptides of the present invention are useful in treating, detecting, and/or preventing said disorders and conditions, in addition to other types of degenerative conditions. Thus this protein may modulate apoptosis or tissue differentiation and is useful in the detection, treatment, and/or prevention of degenerative or proliferative conditions and diseases. The protein is useful in modulating the immune response to aberrant polypeptides, as may exist in proliferating and cancerous cells and tissues. The protein can also be used to gain new insight into the regulation of cellular growth and proliferation. Furthermore, the protein may also be used to determine biological activity, to raise antibodies, as tissue markers, to isolate cognate ligands or receptors, to identify agents that modulate their interactions, in addition to its use as a nutritional supplement. Protein, as well as, antibodies directed against the protein may show utility as a tumor marker and/or immunotherapy targets for the above listed tissues.

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:107 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general

formula of a-b, where a is any integer between 1 to 816 of SEQ ID NO:107, b is an integer of 15 to 830, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:107, and where b is greater than or equal to a + 14.

5 FEATURES OF PROTEIN ENCODED BY GENE NO: 98

This gene is expressed primarily in macrophages and breast cancer tissue and to a lesser extent in osteoblasts and smooth muscle.

Therefore, polynucleotides and polypeptides of the invention are useful as reagents for differential identification of the tissue(s) or cell type(s) present in a biological sample and for diagnosis of diseases and conditions which include, but are not limited to, immune system dysfunction; inflammation; breast cancer; cancer; osteoporosis; osteopetrosis; peristaltic disorders. Similarly, polypeptides and antibodies directed to these polypeptides are useful in providing immunological probes for differential identification of the tissue(s) or cell type(s). For a number of disorders of the above tissues or cells, particularly of the immune and skeletal systems, expression of this gene at significantly higher or lower levels is routinely detected in certain tissues or cell types (e.g., cancerous and wounded tissues) or bodily fluids (e.g., serum, plasma, urine, synovial fluid and spinal fluid) or another tissue or cell sample taken from an individual having such a disorder, relative to the standard gene expression level, i.e., the expression level in healthy tissue or bodily fluid from an individual not having the disorder.

Preferred polypeptides of the present invention comprise immunogenic epitopes shown in SEQ ID NO: 221 as residues: Glu-16 to Ala-40. Polynucleotides encoding said polypeptides are also provided.

The tissue distribution indicates that polynucleotides and polypeptides corresponding to this gene are useful for the diagnosis and/or treatment of a variety of disorders. Expression in macrophages and other hematopoietic cell types indicates that this gene product is involved in the regulation of hematopoietic cell survival, proliferation, differentiation, or activation. It is involved in the control of such processes as immune surveillance, antigen presentation, T cell activation, cytokine release, and inflammation. Expression in breast cancer tissue may possibly correlate with the diagnosis and differentiation of cancerous tissue from normal breast tissue.

5

10

Expression in osteoblasts and osteoclasts may implicate this gene product in the process of bone turnover, and target it as a likely candidate for the treatment of osteoporosis and/or osteopetrosis. Finally, expression in smooth muscle may indicate an involvement in the normal function of numerous internal organs and in the function of the digestive system.

15

20

25

Many polynucleotide sequences, such as EST sequences, are publicly available and accessible through sequence databases. Some of these sequences are related to SEQ ID NO:108 and may have been publicly available prior to conception of the present invention. Preferably, such related polynucleotides are specifically excluded from the scope of the present invention. To list every related sequence is cumbersome. Accordingly, preferably excluded from the present invention are one or more polynucleotides comprising a nucleotide sequence described by the general formula of a-b, where a is any integer between 1 to 1287 of SEQ ID NO:108, b is an integer of 15 to 1301, where both a and b correspond to the positions of nucleotide residues shown in SEQ ID NO:108, and where b is greater than or equal to a + 14.

5

10

Table 1 summarizes the information corresponding to each "Gene No." described above. The nucleotide sequence identified as "NT SEQ ID NO:X" was assembled from partially homologous ("overlapping") sequences obtained from the "cDNA clone ID" identified in Table 1 and, in some cases, from additional related DNA clones. The overlapping sequences were assembled into a single contiguous sequence of high redundancy (usually three to five overlapping sequences at each nucleotide position), resulting in a final sequence identified as SEQ ID NO:X.

15

20

The cDNA Clone ID was deposited on the date and given the corresponding deposit number listed in "ATCC Deposit No:Z and Date." Some of the deposits contain multiple different clones corresponding to the same gene. "Vector" refers to the type of vector contained in the cDNA Clone ID.

25

30

"Total NT Seq." refers to the total number of nucleotides in the contig identified by "Gene No." The deposited clone may contain all or most of these sequences, reflected by the nucleotide position indicated as "5' NT of Clone Seq." and the "3' NT of Clone Seq." of SEQ ID NO:X. The nucleotide position of SEQ ID NO:X of the putative start codon (methionine) is identified as "5' NT of Start Codon." Similarly, the nucleotide position of SEQ ID NO:X of the predicted signal sequence is identified as "5' NT of First AA of Signal Pep."

35

The translated amino acid sequence, beginning with the methionine, is identified as "AA SEQ ID NO:Y," although other reading frames can also be easily translated using known molecular biology techniques. The polypeptides produced by these alternative open reading frames are specifically contemplated by the present invention.

40

45

The first and last amino acid position of SEQ ID NO:Y of the predicted signal peptide is identified as "First AA of Sig Pep" and "Last AA of Sig Pep." The predicted first amino acid position of SEQ ID NO:Y of the secreted portion is identified as "Predicted First AA of Secreted Portion." Finally, the amino acid position of SEQ ID NO:Y of the last amino acid in the open reading frame is identified as "Last AA of ORF."

50

SEQ ID NO:X and the translated SEQ ID NO:Y are sufficiently accurate and otherwise suitable for a variety of uses well known in the art and described further below. For instance, SEQ ID NO:X is useful for designing nucleic acid hybridization

55

5 probes that will detect nucleic acid sequences contained in SEQ ID NO:X or the
cDNA contained in the deposited clone. These probes will also hybridize to nucleic
10 acid molecules in biological samples, thereby enabling a variety of forensic and
diagnostic methods of the invention. Similarly, polypeptides identified from SEQ ID
5 NO:Y may be used to generate antibodies which bind specifically to the secreted
proteins encoded by the cDNA clones identified in Table 1.

15 Nevertheless, DNA sequences generated by sequencing reactions can contain
sequencing errors. The errors exist as misidentified nucleotides, or as insertions or
deletions of nucleotides in the generated DNA sequence. The erroneously inserted or
20 deleted nucleotides cause frame shifts in the reading frames of the predicted amino
acid sequence. In these cases, the predicted amino acid sequence diverges from the
actual amino acid sequence, even though the generated DNA sequence may be greater
than 99.9% identical to the actual DNA sequence (for example, one base insertion or
25 deletion in an open reading frame of over 1000 bases).

15 Accordingly, for those applications requiring precision in the nucleotide
sequence or the amino acid sequence, the present invention provides not only the
generated nucleotide sequence identified as SEQ ID NO:X and the predicted
30 translated amino acid sequence identified as SEQ ID NO:Y, but also a sample of
plasmid DNA containing a human cDNA of the invention deposited with the ATCC,
20 as set forth in Table 1. The nucleotide sequence of each deposited clone can readily
be determined by sequencing the deposited clone in accordance with known methods.
35 The predicted amino acid sequence can then be verified from such deposits.
Moreover, the amino acid sequence of the protein encoded by a particular clone can
also be directly determined by peptide sequencing or by expressing the protein in a
40 25 suitable host cell containing the deposited human cDNA, collecting the protein, and
determining its sequence.

The present invention also relates to the genes corresponding to SEQ ID
45 NO:X, SEQ ID NO:Y, or the deposited clone. The corresponding gene can be
isolated in accordance with known methods using the sequence information disclosed
30 herein. Such methods include preparing probes or primers from the disclosed
sequence and identifying or amplifying the corresponding gene from appropriate
50 sources of genomic material.

Also provided in the present invention are species homologs. Species homologs may be isolated and identified by making suitable probes or primers from the sequences provided herein and screening a suitable nucleic acid source for the desired homologue.

The polypeptides of the invention can be prepared in any suitable manner. Such polypeptides include isolated naturally occurring polypeptides, recombinantly produced polypeptides, synthetically produced polypeptides, or polypeptides produced by a combination of these methods. Means for preparing such polypeptides are well understood in the art.

The polypeptides may be in the form of the secreted protein, including the mature form, or may be a part of a larger protein, such as a fusion protein (see below). It is often advantageous to include an additional amino acid sequence which contains secretory or leader sequences, pro-sequences, sequences which aid in purification, such as multiple histidine residues, or an additional sequence for stability during recombinant production.

The polypeptides of the present invention are preferably provided in an isolated form, and preferably are substantially purified. A recombinantly produced version of a polypeptide, including the secreted polypeptide, can be substantially purified by the one-step method described in Smith and Johnson, *Gene* 67:31-40 (1988). Polypeptides of the invention also can be purified from natural or recombinant sources using antibodies of the invention raised against the secreted protein in methods which are well known in the art.

Signal Sequences

Methods for predicting whether a protein has a signal sequence, as well as the cleavage point for that sequence, are available. For instance, the method of McGeoch, *Virus Res.* 3:271-286 (1985), uses the information from a short N-terminal charged region and a subsequent uncharged region of the complete (uncleaved) protein. The method of von Heinje, *Nucleic Acids Res.* 14:4683-4690 (1986) uses the information from the residues surrounding the cleavage site, typically residues -13 to +2, where +1 indicates the amino terminus of the secreted protein. The accuracy of predicting the cleavage points of known mammalian secretory proteins for each of

these methods is in the range of 75-80%. (von Heinje, supra.) However, the two methods do not always produce the same predicted cleavage point(s) for a given protein.

In the present case, the deduced amino acid sequence of the secreted polypeptide was analyzed by a computer program called SignalP (Henrik Nielsen et al., Protein Engineering 10:1-6 (1997)), which predicts the cellular location of a protein based on the amino acid sequence. As part of this computational prediction of localization, the methods of McGeoch and von Heinje are incorporated. The analysis of the amino acid sequences of the secreted proteins described herein by this program provided the results shown in Table 1.

As one of ordinary skill would appreciate, however, cleavage sites sometimes vary from organism to organism and cannot be predicted with absolute certainty. Accordingly, the present invention provides secreted polypeptides having a sequence shown in SEQ ID NO:Y which have an N-terminus beginning within 5 residues (i.e., + or - 5 residues) of the predicted cleavage point. Similarly, it is also recognized that in some cases, cleavage of the signal sequence from a secreted protein is not entirely uniform, resulting in more than one secreted species. These polypeptides, and the polynucleotides encoding such polypeptides, are contemplated by the present invention.

Moreover, the signal sequence identified by the above analysis may not necessarily predict the naturally occurring signal sequence. For example, the naturally occurring signal sequence may be further upstream from the predicted signal sequence. However, it is likely that the predicted signal sequence will be capable of directing the secreted protein to the ER. These polypeptides, and the polynucleotides encoding such polypeptides, are contemplated by the present invention.

Polynucleotide and Polypeptide Variants

"Variant" refers to a polynucleotide or polypeptide differing from the polynucleotide or polypeptide of the present invention, but retaining essential properties thereof. Generally, variants are overall closely similar, and, in many regions, identical to the polynucleotide or polypeptide of the present invention.

By a polynucleotide having a nucleotide sequence at least, for example, 95%

5 "identical" to a reference nucleotide sequence of the present invention, it is intended
that the nucleotide sequence of the polynucleotide is identical to the reference
10 sequence except that the polynucleotide sequence may include up to five point
mutations per each 100 nucleotides of the reference nucleotide sequence encoding the
5 polypeptide. In other words, to obtain a polynucleotide having a nucleotide sequence
at least 95% identical to a reference nucleotide sequence, up to 5% of the nucleotides
15 in the reference sequence may be deleted or substituted with another nucleotide, or a
number of nucleotides up to 5% of the total nucleotides in the reference sequence may
be inserted into the reference sequence. The query sequence may be an entire
20 sequence shown in Table 1, the ORF (open reading frame), or any fragment specified
as described herein.

As a practical matter, whether any particular nucleic acid molecule or
25 polypeptide is at least 90%, 95%, 96%, 97%, 98% or 99% identical to a nucleotide
sequence of the present invention can be determined conventionally using known
15 computer programs. A preferred method for determining the best overall match
between a query sequence (a sequence of the present invention) and a subject
sequence, also referred to as a global sequence alignment, can be determined using
30 the FASTDB computer program based on the algorithm of Brutlag et al. (Comp. App.
Biosci. (1990) 6:237-245). In a sequence alignment the query and subject sequences
20 are both DNA sequences. An RNA sequence can be compared by converting U's to
T's. The result of said global sequence alignment is in percent identity. Preferred
35 parameters used in a FASTDB alignment of DNA sequences to calculate percent
identity are: Matrix=Unitary, k-tuple=4, Mismatch Penalty=1, Joining Penalty=30,
Randomization Group Length=0, Cutoff Score=1, Gap Penalty=5, Gap Size Penalty
40 25 0.05, Window Size=500 or the length of the subject nucleotide sequence, whichever is
shorter.

If the subject sequence is shorter than the query sequence because of 5' or 3'
45 deletions, not because of internal deletions, a manual correction must be made to the
results. This is because the FASTDB program does not account for 5' and 3'
30 truncations of the subject sequence when calculating percent identity. For subject
sequences truncated at the 5' or 3' ends, relative to the query sequence, the
50 percent identity is corrected by calculating the number of bases of the query sequence

that are 5' and 3' of the subject sequence, which are not matched/aligned, as a percent of the total bases of the query sequence. Whether a nucleotide is matched/aligned is determined by results of the FASTDB sequence alignment. This percentage is then subtracted from the percent identity, calculated by the above FASTDB program using the specified parameters, to arrive at a final percent identity score. This corrected score is what is used for the purposes of the present invention. Only bases outside the 5' and 3' bases of the subject sequence, as displayed by the FASTDB alignment, which are not matched/aligned with the query sequence, are calculated for the purposes of manually adjusting the percent identity score.

For example, a 90 base subject sequence is aligned to a 100 base query sequence to determine percent identity. The deletions occur at the 5' end of the subject sequence and therefore, the FASTDB alignment does not show a matched/alignment of the first 10 bases at 5' end. The 10 unpaired bases represent 10% of the sequence (number of bases at the 5' and 3' ends not matched/total number of bases in the query sequence) so 10% is subtracted from the percent identity score calculated by the FASTDB program. If the remaining 90 bases were perfectly matched the final percent identity would be 90%. In another example, a 90 base subject sequence is compared with a 100 base query sequence. This time the deletions are internal deletions so that there are no bases on the 5' or 3' of the subject sequence which are not matched/aligned with the query. In this case the percent identity calculated by FASTDB is not manually corrected. Once again, only bases 5' and 3' of the subject sequence which are not matched/aligned with the query sequence are manually corrected for. No other manual corrections are to made for the purposes of the present invention.

By a polypeptide having an amino acid sequence at least, for example, 95% "identical" to a query amino acid sequence of the present invention, it is intended that the amino acid sequence of the subject polypeptide is identical to the query sequence except that the subject polypeptide sequence may include up to five amino acid alterations per each 100 amino acids of the query amino acid sequence. In other words, to obtain a polypeptide having an amino acid sequence at least 95% identical to a query amino acid sequence, up to 5% of the amino acid residues in the subject sequence may be inserted, deleted, (indels) or substituted with another amino acid.

These alterations of the reference sequence may occur at the amino or carboxy terminal positions of the reference amino acid sequence or anywhere between those terminal positions, interspersed either individually among residues in the reference sequence or in one or more contiguous groups within the reference sequence.

As a practical matter, whether any particular polypeptide is at least 90%, 95%, 96%, 97%, 98% or 99% identical to, for instance, the amino acid sequences shown in Table 1 or to the amino acid sequence encoded by deposited DNA clone can be determined conventionally using known computer programs. A preferred method for determining the best overall match between a query sequence (a sequence of the present invention) and a subject sequence, also referred to as a global sequence alignment, can be determined using the FASTDB computer program based on the algorithm of Brutlag et al. (Comp. App. Biosci. (1990) 6:237-245). In a sequence alignment the query and subject sequences are either both nucleotide sequences or both amino acid sequences. The result of said global sequence alignment is in percent identity.

15
20
25
30
35
40
45
50
55

Preferred parameters used in a FASTDB amino acid alignment are: Matrix=PAM 0, k-tuple=2, Mismatch Penalty=1, Joining Penalty=20, Randomization Group Length=0, Cutoff Score=1, Window Size=sequence length, Gap Penalty=5, Gap Size Penalty=0.05, Window Size=500 or the length of the subject amino acid sequence, whichever is shorter.

20
25
30
35
40
45
50
55

If the subject sequence is shorter than the query sequence due to N- or C-terminal deletions, not because of internal deletions, a manual correction must be made to the results. This is because the FASTDB program does not account for N- and C-terminal truncations of the subject sequence when calculating global percent identity. For subject sequences truncated at the N- and C-termini, relative to the query sequence, the percent identity is corrected by calculating the number of residues of the query sequence that are N- and C-terminal of the subject sequence, which are not matched/aligned with a corresponding subject residue, as a percent of the total bases of the query sequence. Whether a residue is matched/aligned is determined by results of the FASTDB sequence alignment. This percentage is then subtracted from the percent identity, calculated by the above FASTDB program using the specified parameters, to arrive at a final percent identity score. This final percent identity score is what is used for the purposes of the present invention. Only residues to the N- and

C-termini of the subject sequence, which are not matched/aligned with the query sequence, are considered for the purposes of manually adjusting the percent identity score. That is, only query residue positions outside the farthest N- and C-terminal residues of the subject sequence.

For example, a 90 amino acid residue subject sequence is aligned with a 100 residue query sequence to determine percent identity. The deletion occurs at the N-terminus of the subject sequence and therefore, the FASTDB alignment does not show a matching/alignment of the first 10 residues at the N-terminus. The 10 unpaired residues represent 10% of the sequence (number of residues at the N- and C-termini not matched/total number of residues in the query sequence) so 10% is subtracted from the percent identity score calculated by the FASTDB program. If the remaining 90 residues were perfectly matched the final percent identity would be 90%. In another example, a 90 residue subject sequence is compared with a 100 residue query sequence. This time the deletions are internal deletions so there are no residues at the N- or C-termini of the subject sequence which are not matched/aligned with the query. In this case the percent identity calculated by FASTDB is not manually corrected. Once again, only residue positions outside the N- and C-terminal ends of the subject sequence, as displayed in the FASTDB alignment, which are not matched/aligned with the query sequence are manually corrected for. No other manual corrections are to be made for the purposes of the present invention.

The variants may contain alterations in the coding regions, non-coding regions, or both. Especially preferred are polynucleotide variants containing alterations which produce silent substitutions, additions, or deletions, but do not alter the properties or activities of the encoded polypeptide. Nucleotide variants produced by silent substitutions due to the degeneracy of the genetic code are preferred. Moreover, variants in which 5-10, 1-5, or 1-2 amino acids are substituted, deleted, or added in any combination are also preferred. Polynucleotide variants can be produced for a variety of reasons, e.g., to optimize codon expression for a particular host (change codons in the human mRNA to those preferred by a bacterial host such as *E. coli*).

Naturally occurring variants are called "allelic variants," and refer to one of several alternate forms of a gene occupying a given locus on a chromosome of an

organism. (Genes II, Lewin, B., ed., John Wiley & Sons, New York (1985).) These allelic variants can vary at either the polynucleotide and/or polypeptide level.

Alternatively, non-naturally occurring variants may be produced by mutagenesis techniques or by direct synthesis.

Using known methods of protein engineering and recombinant DNA technology, variants may be generated to improve or alter the characteristics of the polypeptides of the present invention. For instance, one or more amino acids can be deleted from the N-terminus or C-terminus of the secreted protein without substantial loss of biological function. The authors of Ron et al., J. Biol. Chem. 268: 2984-2988 (1993), reported variant KGF proteins having heparin binding activity even after deleting 3, 8, or 27 amino-terminal amino acid residues. Similarly, Interferon gamma exhibited up to ten times higher activity after deleting 8-10 amino acid residues from the carboxy terminus of this protein. (Dobeli et al., J. Biotechnology 7:199-216 (1988).)

Moreover, ample evidence demonstrates that variants often retain a biological activity similar to that of the naturally occurring protein. For example, Gayle and coworkers (J. Biol. Chem 268:22105-22111 (1993)) conducted extensive mutational analysis of human cytokine IL-1a. They used random mutagenesis to generate over 3,500 individual IL-1a mutants that averaged 2.5 amino acid changes per variant over the entire length of the molecule. Multiple mutations were examined at every possible amino acid position. The investigators found that "[m]ost of the molecule could be altered with little effect on either [binding or biological activity]." (See, Abstract.) In fact, only 23 unique amino acid sequences, out of more than 3,500 nucleotide sequences examined, produced a protein that significantly differed in activity from wild-type.

Furthermore, even if deleting one or more amino acids from the N-terminus or C-terminus of a polypeptide results in modification or loss of one or more biological functions, other biological activities may still be retained. For example, the ability of a deletion variant to induce and/or to bind antibodies which recognize the secreted form will likely be retained when less than the majority of the residues of the secreted form are removed from the N-terminus or C-terminus. Whether a particular polypeptide lacking N- or C-terminal residues of a protein retains such immunogenic

activities can readily be determined by routine methods described herein and otherwise known in the art.

Thus, the invention further includes polypeptide variants which show substantial biological activity. Such variants include deletions, insertions, inversions, repeats, and substitutions selected according to general rules known in the art so as to have little effect on activity. For example, guidance concerning how to make phenotypically silent amino acid substitutions is provided in Bowie, J. U. et al., Science 247:1306-1310 (1990), wherein the authors indicate that there are two main strategies for studying the tolerance of an amino acid sequence to change.

The first strategy exploits the tolerance of amino acid substitutions by natural selection during the process of evolution. By comparing amino acid sequences in different species, conserved amino acids can be identified. These conserved amino acids are likely important for protein function. In contrast, the amino acid positions where substitutions have been tolerated by natural selection indicates that these positions are not critical for protein function. Thus, positions tolerating amino acid substitution could be modified while still maintaining biological activity of the protein.

The second strategy uses genetic engineering to introduce amino acid changes at specific positions of a cloned gene to identify regions critical for protein function. For example, site directed mutagenesis or alanine-scanning mutagenesis (introduction of single alanine mutations at every residue in the molecule) can be used. (Cunningham and Wells, Science 244:1081-1085 (1989).) The resulting mutant molecules can then be tested for biological activity.

As the authors state, these two strategies have revealed that proteins are surprisingly tolerant of amino acid substitutions. The authors further indicate which amino acid changes are likely to be permissive at certain amino acid positions in the protein. For example, most buried (within the tertiary structure of the protein) amino acid residues require nonpolar side chains, whereas few features of surface side chains are generally conserved. Moreover, tolerated conservative amino acid substitutions involve replacement of the aliphatic or hydrophobic amino acids Ala, Val, Leu and Ile; replacement of the hydroxyl residues Ser and Thr; replacement of the acidic residues Asp and Glu; replacement of the amide residues Asn and Gln, replacement of

the basic residues Lys, Arg, and His; replacement of the aromatic residues Phe, Tyr, and Trp, and replacement of the small-sized amino acids Ala, Ser, Thr, Met, and Gly.

Besides conservative amino acid substitution, variants of the present invention include (i) substitutions with one or more of the non-conserved amino acid residues, where the substituted amino acid residues may or may not be one encoded by the genetic code, or (ii) substitution with one or more of amino acid residues having a substituent group, or (iii) fusion of the mature polypeptide with another compound, such as a compound to increase the stability and/or solubility of the polypeptide (for example, polyethylene glycol), or (iv) fusion of the polypeptide with additional amino acids, such as an IgG Fc fusion region peptide, or leader or secretory sequence, or a sequence facilitating purification. Such variant polypeptides are deemed to be within the scope of those skilled in the art from the teachings herein.

For example, polypeptide variants containing amino acid substitutions of charged amino acids with other charged or neutral amino acids may produce proteins with improved characteristics, such as less aggregation. Aggregation of pharmaceutical formulations both reduces activity and increases clearance due to the aggregate's immunogenic activity. (Pinckard et al., Clin. Exp. Immunol. 2:331-340 (1967); Robbins et al., Diabetes 36: 838-845 (1987); Cleland et al., Crit. Rev. Therapeutic Drug Carrier Systems 10:307-377 (1993).)

A further embodiment of the invention relates to a polypeptide which comprises the amino acid sequence of the present invention having an amino acid sequence which contains at least one amino acid substitution, but not more than 50 amino acid substitutions, even more preferably, not more than 40 amino acid substitutions, still more preferably, not more than 30 amino acid substitutions, and still even more preferably, not more than 20 amino acid substitutions. Of course, in order of ever-increasing preference, it is highly preferable for a polypeptide to have an amino acid sequence which comprises the amino acid sequence of the present invention, which contains at least one, but not more than 10, 9, 8, 7, 6, 5, 4, 3, 2 or 1 amino acid substitutions. In specific embodiments, the number of additions, substitutions, and/or deletions in the amino acid sequence of the present invention or fragments thereof (e.g., the mature form and/or other fragments described herein), is

1-5, 5-10, 5-25, 5-50, 10-50 or 50-150, conservative amino acid substitutions are preferable.

Polynucleotide and Polypeptide Fragments

In the present invention, a "polynucleotide fragment" refers to a short polynucleotide having a nucleic acid sequence contained in the deposited clone or shown in SEQ ID NO:X. The short nucleotide fragments are preferably at least about 15 nt, and more preferably at least about 20 nt, still more preferably at least about 30 nt, and even more preferably, at least about 40 nt in length. A fragment "at least 20 nt in length," for example, is intended to include 20 or more contiguous bases from the cDNA sequence contained in the deposited clone or the nucleotide sequence shown in SEQ ID NO:X. These nucleotide fragments are useful as diagnostic probes and primers as discussed herein. Of course, larger fragments (e.g., 50, 150, 500, 600, 2000 nucleotides) are preferred.

Moreover, representative examples of polynucleotide fragments of the invention, include, for example, fragments having a sequence from about nucleotide number 1-50, 51-100, 101-150, 151-200, 201-250, 251-300, 301-350, 351-400, 401-450, 451-500, 501-550, 551-600, 651-700, 701-750, 751-800, 800-850, 851-900, 901-950, 951-1000, 1001-1050, 1051-1100, 1101-1150, 1151-1200, 1201-1250, 1251-1300, 1301-1350, 1351-1400, 1401-1450, 1451-1500, 1501-1550, 1551-1600, 1601-1650, 1651-1700, 1701-1750, 1751-1800, 1801-1850, 1851-1900, 1901-1950, 1951-2000, or 2001 to the end of SEQ ID NO:X or the cDNA contained in the deposited clone. In this context "about" includes the particularly recited ranges, larger or smaller by several (5, 4, 3, 2, or 1) nucleotides, at either terminus or at both termini. Preferably, these fragments encode a polypeptide which has biological activity. More preferably, these polynucleotides can be used as probes or primers as discussed herein.

In the present invention, a "polypeptide fragment" refers to a short amino acid sequence contained in SEQ ID NO:Y or encoded by the cDNA contained in the deposited clone. Protein fragments may be "free-standing," or comprised within a larger polypeptide of which the fragment forms a part or region, most preferably as a single continuous region. Representative examples of polypeptide fragments of the

invention, include, for example, fragments from about amino acid number 1-20, 21-40, 41-60, 61-80, 81-100, 102-120, 121-140, 141-160, or 161 to the end of the coding region. Moreover, polypeptide fragments can be about 20, 30, 40, 50, 60, 70, 80, 90, 100, 110, 120, 130, 140, or 150 amino acids in length. In this context "about" includes the particularly recited ranges, larger or smaller by several (5, 4, 3, 2, or 1) amino acids, at either extreme or at both extremes.

Preferred polypeptide fragments include the secreted protein as well as the mature form. Further preferred polypeptide fragments include the secreted protein or the mature form having a continuous series of deleted residues from the amino or the carboxy terminus, or both. For example, any number of amino acids, ranging from 1-60, can be deleted from the amino terminus of either the secreted polypeptide or the mature form. Similarly, any number of amino acids, ranging from 1-30, can be deleted from the carboxy terminus of the secreted protein or mature form.

Furthermore, any combination of the above amino and carboxy terminus deletions are preferred. Similarly, polynucleotide fragments encoding these polypeptide fragments are also preferred.

Also preferred are polypeptide and polynucleotide fragments characterized by structural or functional domains, such as fragments that comprise alpha-helix and alpha-helix forming regions, beta-sheet and beta-sheet-forming regions, turn and turn-forming regions, coil and coil-forming regions, hydrophilic regions, hydrophobic regions, alpha amphipathic regions, beta amphipathic regions, flexible regions, surface-forming regions, substrate binding region, and high antigenic index regions. Polypeptide fragments of SEQ ID NO:Y falling within conserved domains are specifically contemplated by the present invention. Moreover, polynucleotide fragments encoding these domains are also contemplated.

Other preferred fragments are biologically active fragments. Biologically active fragments are those exhibiting activity similar, but not necessarily identical, to an activity of the polypeptide of the present invention. The biological activity of the fragments may include an improved desired activity, or a decreased undesirable activity.

Epitopes & Antibodies

5
10
15
In the present invention, "epitopes" refer to polypeptide fragments having antigenic or immunogenic activity in an animal, especially in a human. A preferred embodiment of the present invention relates to a polypeptide fragment comprising an epitope, as well as the polynucleotide encoding this fragment. A region of a protein molecule to which an antibody can bind is defined as an "antigenic epitope." In contrast, an "immunogenic epitope" is defined as a part of a protein that elicits an antibody response. (See, for instance, Geysen et al., Proc. Natl. Acad. Sci. USA 81:3998-4002 (1983).)

20
25
Fragments which function as epitopes may be produced by any conventional means. (See, e.g., Houghten, R. A., Proc. Natl. Acad. Sci. USA 82:5131-5135 (1985) further described in U.S. Patent No. 4,631,211.)

30
35
40
In the present invention, antigenic epitopes preferably contain a sequence of at least seven, more preferably at least nine, and most preferably between about 15 to about 30 amino acids. Antigenic epitopes are useful to raise antibodies, including monoclonal antibodies, that specifically bind the epitope. (See, for instance, Wilson et al., Cell 37:767-778 (1984); Sutcliffe, J. G. et al., Science 219:660-666 (1983).)

45
50
55
Similarly, immunogenic epitopes can be used to induce antibodies according to methods well known in the art. (See, for instance, Sutcliffe et al., supra; Wilson et al., supra; Chow, M. et al., Proc. Natl. Acad. Sci. USA 82:910-914; and Bittle, F. J. et al., J. Gen. Virol. 66:2347-2354 (1985).) A preferred immunogenic epitope includes the secreted protein. The immunogenic epitopes may be presented together with a carrier protein, such as an albumin, to an animal system (such as rabbit or mouse) or, if it is long enough (at least about 25 amino acids), without a carrier. However, immunogenic epitopes comprising as few as 8 to 10 amino acids have been shown to be sufficient to raise antibodies capable of binding to, at the very least, linear epitopes in a denatured polypeptide (e.g., in Western blotting.)

As used herein, the term "antibody" (Ab) or "monoclonal antibody" (Mab) is meant to include intact molecules as well as antibody fragments (such as, for example, Fab and F(ab')₂ fragments) which are capable of specifically binding to protein. Fab and F(ab')₂ fragments lack the Fc fragment of intact antibody, clear more rapidly from the circulation, and may have less non-specific tissue binding than an intact antibody. (Wahl et al., J. Nucl. Med. 24:316-325 (1983).) Thus, these

fragments are preferred, as well as the products of a FAB or other immunoglobulin expression library. Moreover, antibodies of the present invention include chimeric, single chain, and humanized antibodies.

5 Fusion Proteins

Any polypeptide of the present invention can be used to generate fusion proteins. For example, the polypeptide of the present invention, when fused to a second protein, can be used as an antigenic tag. Antibodies raised against the polypeptide of the present invention can be used to indirectly detect the second protein by binding to the polypeptide. Moreover, because secreted proteins target cellular locations based on trafficking signals, the polypeptides of the present invention can be used as targeting molecules once fused to other proteins.

Examples of domains that can be fused to polypeptides of the present invention include not only heterologous signal sequences, but also other heterologous functional regions. The fusion does not necessarily need to be direct, but may occur through linker sequences.

Moreover, fusion proteins may also be engineered to improve characteristics of the polypeptide of the present invention. For instance, a region of additional amino acids, particularly charged amino acids, may be added to the N-terminus of the polypeptide to improve stability and persistence during purification from the host cell or subsequent handling and storage. Also, peptide moieties may be added to the polypeptide to facilitate purification. Such regions may be removed prior to final preparation of the polypeptide. The addition of peptide moieties to facilitate handling of polypeptides are familiar and routine techniques in the art.

Moreover, polypeptides of the present invention, including fragments, and specifically epitopes, can be combined with parts of the constant domain of immunoglobulins (IgG), resulting in chimeric polypeptides. These fusion proteins facilitate purification and show an increased half-life in vivo. One reported example describes chimeric proteins consisting of the first two domains of the human CD4-polypeptide and various domains of the constant regions of the heavy or light chains of mammalian immunoglobulins. (EP A 394,827; Traunecker et al., Nature 331:84-86 (1988).) Fusion proteins having disulfide-linked dimeric structures (due to the

IgG) can also be more efficient in binding and neutralizing other molecules, than the monomeric secreted protein or protein fragment alone. (Fountoulakis et al., J. Biochem. 270:3958-3964 (1995).)

Similarly, EP-A-O 464 533 (Canadian counterpart 2045869) discloses fusion proteins comprising various portions of constant region of immunoglobulin molecules together with another human protein or part thereof. In many cases, the Fc part in a fusion protein is beneficial in therapy and diagnosis, and thus can result in, for example, improved pharmacokinetic properties. (EP-A 0232 262.) Alternatively, deleting the Fc part after the fusion protein has been expressed, detected, and purified, would be desired. For example, the Fc portion may hinder therapy and diagnosis if the fusion protein is used as an antigen for immunizations. In drug discovery, for example, human proteins, such as hIL-5, have been fused with Fc portions for the purpose of high-throughput screening assays to identify antagonists of hIL-5. (See, D. Bennett et al., J. Molecular Recognition 8:52-58 (1995); K. Johanson et al., J. Biol. Chem. 270:9459-9471 (1995).)

Moreover, the polypeptides of the present invention can be fused to marker sequences, such as a peptide which facilitates purification of the fused polypeptide. In preferred embodiments, the marker amino acid sequence is a hexa-histidine peptide, such as the tag provided in a pQE vector (QIAGEN, Inc., 9259 Eton Avenue, Chatsworth, CA, 91311), among others, many of which are commercially available. As described in Gentz et al., Proc. Natl. Acad. Sci. USA 86:821-824 (1989), for instance, hexa-histidine provides for convenient purification of the fusion protein. Another peptide tag useful for purification, the "HA" tag, corresponds to an epitope derived from the influenza hemagglutinin protein. (Wilson et al., Cell 37:767 (1984).)

Thus, any of these above fusions can be engineered using the polynucleotides or the polypeptides of the present invention.

Vectors, Host Cells, and Protein Production

The present invention also relates to vectors containing the polynucleotide of the present invention, host cells, and the production of polypeptides by recombinant techniques. The vector may be, for example, a phage, plasmid, viral, or retroviral

vector. Retroviral vectors may be replication competent or replication defective. In the latter case, viral propagation generally will occur only in complementing host cells.

The polynucleotides may be joined to a vector containing a selectable marker for propagation in a host. Generally, a plasmid vector is introduced in a precipitate, such as a calcium phosphate precipitate, or in a complex with a charged lipid. If the vector is a virus, it may be packaged in vitro using an appropriate packaging cell line and then transduced into host cells.

The polynucleotide insert should be operatively linked to an appropriate promoter, such as the phage lambda PL promoter, the E. coli lac, trp, phoA and tac promoters, the SV40 early and late promoters and promoters of retroviral LTRs, to name a few. Other suitable promoters will be known to the skilled artisan. The expression constructs will further contain sites for transcription initiation, termination, and, in the transcribed region, a ribosome binding site for translation. The coding portion of the transcripts expressed by the constructs will preferably include a translation initiating codon at the beginning and a termination codon (UAA, UGA or UAG) appropriately positioned at the end of the polypeptide to be translated.

As indicated, the expression vectors will preferably include at least one selectable marker. Such markers include dihydrofolate reductase, G418 or neomycin resistance for eukaryotic cell culture and tetracycline, kanamycin or ampicillin resistance genes for culturing in E. coli and other bacteria. Representative examples of appropriate hosts include, but are not limited to, bacterial cells, such as E. coli, Streptomyces and Salmonella typhimurium cells; fungal cells, such as yeast cells; insect cells such as Drosophila S2 and Spodoptera Sf9 cells; animal cells such as CHO, COS, 293, and Bowes melanoma cells; and plant cells. Appropriate culture mediums and conditions for the above-described host cells are known in the art.

Among vectors preferred for use in bacteria include pQE70, pQE60 and pQE-9, available from QIAGEN, Inc.; pBluescript vectors, Phagescript vectors, pNH8A, pNH16a, pNH18A, pNH46A, available from Stratagene Cloning Systems, Inc.; and ptrc99a, pKK223-3, pKK233-3, pDR540, pRIT5 available from Pharmacia Biotech, Inc. Among preferred eukaryotic vectors are pWLNEO, pSV2CAT, pOG44, pXT1

5 and pSG available from Stratagene; and pSVK3, pBPV, pMSG and pSVL available from Pharmacia. Other suitable vectors will be readily apparent to the skilled artisan.

10 Introduction of the construct into the host cell can be effected by calcium phosphate transfection, DEAE-dextran mediated transfection, cationic lipid-mediated transfection, electroporation, transduction, infection, or other methods. Such methods
5 are described in many standard laboratory manuals, such as Davis et al., Basic Methods In Molecular Biology (1986). It is specifically contemplated that the polypeptides of the present invention may in fact be expressed by a host cell lacking a recombinant vector.

15 20 A polypeptide of this invention can be recovered and purified from recombinant cell cultures by well-known methods including ammonium sulfate or ethanol precipitation, acid extraction, anion or cation exchange chromatography, phosphocellulose chromatography, hydrophobic interaction chromatography, affinity chromatography, hydroxylapatite chromatography and lectin chromatography. Most
25 preferably, high performance liquid chromatography ("HPLC") is employed for purification.

30 Polypeptides of the present invention, and preferably the secreted form, can also be recovered from: products purified from natural sources, including bodily fluids, tissues and cells, whether directly isolated or cultured; products of chemical
20 synthetic procedures; and products produced by recombinant techniques from a prokaryotic or eukaryotic host, including, for example, bacterial, yeast, higher plant,
35 insect, and mammalian cells. Depending upon the host employed in a recombinant production procedure, the polypeptides of the present invention may be glycosylated or may be non-glycosylated. In addition, polypeptides of the invention may also
40 25 include an initial modified methionine residue, in some cases as a result of host-mediated processes. Thus, it is well known in the art that the N-terminal methionine encoded by the translation initiation codon generally is removed with high efficiency from any protein after translation in all eukaryotic cells. While the N-terminal
45 methionine on most proteins also is efficiently removed in most prokaryotes, for some
30 proteins, this prokaryotic removal process is inefficient, depending on the nature of the amino acid to which the N-terminal methionine is covalently linked.

In addition to encompassing host cells containing the vector constructs discussed herein, the invention also encompasses primary, secondary, and immortalized host cells of vertebrate origin, particularly mammalian origin, that have been engineered to delete or replace endogenous genetic material (e.g., coding sequence), and/or to include genetic material (e.g., heterologous polynucleotide sequences) that is operably associated with the polynucleotides of the invention, and which activates, alters, and/or amplifies endogenous polynucleotides. For example, techniques known in the art may be used to operably associate heterologous control regions (e.g., promoter and/or enhancer) and endogenous polynucleotide sequences via homologous recombination (see, e.g., U.S. Patent No. 5,641,670, issued June 24, 1997; International Publication No. WO 96/29411, published September 26, 1996; International Publication No. WO 94/12650, published August 4, 1994; Koller et al., Proc. Natl. Acad. Sci. USA 86:8932-8935 (1989); and Zijlstra et al., Nature 342:435-438 (1989), the disclosures of each of which are incorporated by reference in their entireties).

Uses of the Polynucleotides

Each of the polynucleotides identified herein can be used in numerous ways as reagents. The following description should be considered exemplary and utilizes known techniques.

The polynucleotides of the present invention are useful for chromosome identification. There exists an ongoing need to identify new chromosome markers, since few chromosome marking reagents, based on actual sequence data (repeat polymorphisms), are presently available. Each polynucleotide of the present invention can be used as a chromosome marker.

Briefly, sequences can be mapped to chromosomes by preparing PCR primers (preferably 15-25 bp) from the sequences shown in SEQ ID NO:X. Primers can be selected using computer analysis so that primers do not span more than one predicted exon in the genomic DNA. These primers are then used for PCR screening of somatic cell hybrids containing individual human chromosomes. Only those hybrids

5 containing the human gene corresponding to the SEQ ID NO:X will yield an amplified fragment.

10 Similarly, somatic hybrids provide a rapid method of PCR mapping the polynucleotides to particular chromosomes. Three or more clones can be assigned per
5 day using a single thermal cycler. Moreover, sublocalization of the polynucleotides can be achieved with panels of specific chromosome fragments. Other gene mapping
15 strategies that can be used include in situ hybridization, prescreening with labeled flow-sorted chromosomes, and preselection by hybridization to construct chromosome specific-cDNA libraries.

20 Precise chromosomal location of the polynucleotides can also be achieved using fluorescence in situ hybridization (FISH) of a metaphase chromosomal spread. This technique uses polynucleotides as short as 500 or 600 bases; however,
25 polynucleotides 2,000-4,000 bp are preferred. For a review of this technique, see Verma et al., "Human Chromosomes: a Manual of Basic Techniques," Pergamon
15 Press, New York (1988).

For chromosome mapping, the polynucleotides can be used individually (to
30 mark a single chromosome or a single site on that chromosome) or in panels (for marking multiple sites and/or multiple chromosomes). Preferred polynucleotides correspond to the noncoding regions of the cDNAs because the coding sequences are
20 more likely conserved within gene families, thus increasing the chance of cross
35 hybridization during chromosomal mapping.

Once a polynucleotide has been mapped to a precise chromosomal location,
the physical position of the polynucleotide can be used in linkage analysis. Linkage
40 analysis establishes coinheritance between a chromosomal location and presentation
25 of a particular disease. (Disease mapping data are found, for example, in V. McKusick, Mendelian Inheritance in Man (available on line through Johns Hopkins
University Welch Medical Library) .) Assuming 1 megabase mapping resolution and
45 one gene per 20 kb, a cDNA precisely localized to a chromosomal region associated with the disease could be one of 50-500 potential causative genes.

30 Thus, once coinheritance is established, differences in the polynucleotide and the corresponding gene between affected and unaffected individuals can be examined.
50 First, visible structural alterations in the chromosomes, such as deletions or

translocations, are examined in chromosome spreads or by PCR. If no structural alterations exist, the presence of point mutations are ascertained. Mutations observed in some or all affected individuals, but not in normal individuals, indicates that the mutation may cause the disease. However, complete sequencing of the polypeptide and the corresponding gene from several normal individuals is required to distinguish the mutation from a polymorphism. If a new polymorphism is identified, this polymorphic polypeptide can be used for further linkage analysis.

Furthermore, increased or decreased expression of the gene in affected individuals as compared to unaffected individuals can be assessed using polynucleotides of the present invention. Any of these alterations (altered expression, chromosomal rearrangement, or mutation) can be used as a diagnostic or prognostic marker.

In addition to the foregoing, a polynucleotide can be used to control gene expression through triple helix formation or antisense DNA or RNA. Both methods rely on binding of the polynucleotide to DNA or RNA. For these techniques, preferred polynucleotides are usually 20 to 40 bases in length and complementary to either the region of the gene involved in transcription (triple helix - see Lee et al., Nucl. Acids Res. 6:3073 (1979); Cooney et al., Science 241:456 (1988); and Dervan et al., Science 251:1360 (1991)) or to the mRNA itself (antisense - Okano, J. Neurochem. 56:560 (1991); Oligodeoxy-nucleotides as Antisense Inhibitors of Gene Expression, CRC Press, Boca Raton, FL (1988).) Triple helix formation optimally results in a shut-off of RNA transcription from DNA, while antisense RNA hybridization blocks translation of an mRNA molecule into polypeptide. Both techniques are effective in model systems, and the information disclosed herein can be used to design antisense or triple helix polynucleotides in an effort to treat disease.

Polynucleotides of the present invention are also useful in gene therapy. One goal of gene therapy is to insert a normal gene into an organism having a defective gene, in an effort to correct the genetic defect. The polynucleotides disclosed in the present invention offer a means of targeting such genetic defects in a highly accurate manner. Another goal is to insert a new gene that was not present in the host genome, thereby producing a new trait in the host cell.

5 The polynucleotides are also useful for identifying individuals from minute
biological samples. The United States military, for example, is considering the use of
10 restriction fragment length polymorphism (RFLP) for identification of its personnel.
In this technique, an individual's genomic DNA is digested with one or more
5 restriction enzymes, and probed on a Southern blot to yield unique bands for
identifying personnel. This method does not suffer from the current limitations of
15 "Dog Tags" which can be lost, switched, or stolen, making positive identification
difficult. The polynucleotides of the present invention can be used as additional DNA
markers for RFLP.

20 10 The polynucleotides of the present invention can also be used as an alternative
to RFLP, by determining the actual base-by-base DNA sequence of selected portions
of an individual's genome. These sequences can be used to prepare PCR primers for
amplifying and isolating such selected DNA, which can then be sequenced. Using
25 this technique, individuals can be identified because each individual will have a
15 unique set of DNA sequences. Once an unique ID database is established for an
individual, positive identification of that individual, living or dead, can be made from
extremely small tissue samples.

30 Forensic biology also benefits from using DNA-based identification
techniques as disclosed herein. DNA sequences taken from very small biological
20 samples such as tissues, e.g., hair or skin, or body fluids, e.g., blood, saliva, semen,
etc., can be amplified using PCR. In one prior art technique, gene sequences
35 amplified from polymorphic loci, such as DQa class II HLA gene, are used in forensic
biology to identify individuals. (Erllich, H., PCR Technology, Freeman and Co.
(1992).) Once these specific polymorphic loci are amplified, they are digested with
40 25 one or more restriction enzymes, yielding an identifying set of bands on a Southern
blot probed with DNA corresponding to the DQa class II HLA gene. Similarly,
polynucleotides of the present invention can be used as polymorphic markers for
45 forensic purposes.

50 30 There is also a need for reagents capable of identifying the source of a
particular tissue. Such need arises, for example, in forensics when presented with
tissue of unknown origin. Appropriate reagents can comprise, for example, DNA
probes or primers specific to particular tissue prepared from the sequences of the
55

5 present invention. Panels of such reagents can identify tissue by species and/or by
organ type. In a similar fashion, these reagents can be used to screen tissue cultures
10 for contamination.

In the very least, the polynucleotides of the present invention can be used as
5 molecular weight markers on Southern gels, as diagnostic probes for the presence of a
specific mRNA in a particular cell type, as a probe to "subtract-out" known sequences
15 in the process of discovering novel polynucleotides, for selecting and making
oligomers for attachment to a "gene chip" or other support, to raise anti-DNA
antibodies using DNA immunization techniques, and as an antigen to elicit an
20 immune response.

Uses of the Polypeptides

Each of the polypeptides identified herein can be used in numerous ways. The
25 following description should be considered exemplary and utilizes known techniques.

15 A polypeptide of the present invention can be used to assay protein levels in a
biological sample using antibody-based techniques. For example, protein expression
in tissues can be studied with classical immunohistological methods. (Jalkanen, M.,
30 et al., J. Cell. Biol. 101:976-985 (1985); Jalkanen, M., et al., J. Cell. Biol. 105:3087-
3096 (1987).) Other antibody-based methods useful for detecting protein gene
20 expression include immunoassays, such as the enzyme linked immunosorbent assay
(ELISA) and the radioimmunoassay (RIA). Suitable antibody assay labels are known
35 in the art and include enzyme labels, such as, glucose oxidase, and radioisotopes, such
as iodine (125I, 121I), carbon (14C), sulfur (35S), tritium (3H), indium (112In), and
technetium (99mTc), and fluorescent labels, such as fluorescein and rhodamine, and
40 biotin.

In addition to assaying secreted protein levels in a biological sample, proteins
can also be detected in vivo by imaging. Antibody labels or markers for in vivo
45 imaging of protein include those detectable by X-radiography, NMR or ESR. For X-
radiography, suitable labels include radioisotopes such as barium or cesium, which
30 emit detectable radiation but are not overtly harmful to the subject. Suitable markers
for NMR and ESR include those with a detectable characteristic spin, such as

deuterium, which may be incorporated into the antibody by labeling of nutrients for the relevant hybridoma.

A protein-specific antibody or antibody fragment which has been labeled with an appropriate detectable imaging moiety, such as a radioisotope (for example, ^{131}I , ^{112}In , $^{99\text{m}}\text{Tc}$), a radio-opaque substance, or a material detectable by nuclear magnetic resonance, is introduced (for example, parenterally, subcutaneously, or intraperitoneally) into the mammal. It will be understood in the art that the size of the subject and the imaging system used will determine the quantity of imaging moiety needed to produce diagnostic images. In the case of a radioisotope moiety, for a human subject, the quantity of radioactivity injected will normally range from about 5 to 20 millicuries of $^{99\text{m}}\text{Tc}$. The labeled antibody or antibody fragment will then preferentially accumulate at the location of cells which contain the specific protein. In vivo tumor imaging is described in S.W. Burchiel et al., "Immunopharmacokinetics of Radiolabeled Antibodies and Their Fragments." (Chapter 13 in Tumor Imaging: The Radiochemical Detection of Cancer, S.W. Burchiel and B. A. Rhodes, eds., Masson Publishing Inc. (1982).)

Thus, the invention provides a diagnostic method of a disorder, which involves (a) assaying the expression of a polypeptide of the present invention in cells or body fluid of an individual; (b) comparing the level of gene expression with a standard gene expression level, whereby an increase or decrease in the assayed polypeptide gene expression level compared to the standard expression level is indicative of a disorder.

Moreover, polypeptides of the present invention can be used to treat disease. For example, patients can be administered a polypeptide of the present invention in an effort to replace absent or decreased levels of the polypeptide (e.g., insulin), to supplement absent or decreased levels of a different polypeptide (e.g., hemoglobin S for hemoglobin B), to inhibit the activity of a polypeptide (e.g., an oncogene), to activate the activity of a polypeptide (e.g., by binding to a receptor), to reduce the activity of a membrane bound receptor by competing with it for free ligand (e.g., soluble TNF receptors used in reducing inflammation), or to bring about a desired response (e.g., blood vessel growth).

Similarly, antibodies directed to a polypeptide of the present invention can also be used to treat disease. For example, administration of an antibody directed to a polypeptide of the present invention can bind and reduce overproduction of the polypeptide. Similarly, administration of an antibody can activate the polypeptide, such as by binding to a polypeptide bound to a membrane (receptor).

At the very least, the polypeptides of the present invention can be used as molecular weight markers on SDS-PAGE gels or on molecular sieve gel filtration columns using methods well known to those of skill in the art. Polypeptides can also be used to raise antibodies, which in turn are used to measure protein expression from a recombinant cell, as a way of assessing transformation of the host cell. Moreover, the polypeptides of the present invention can be used to test the following biological activities.

Biological Activities

The polynucleotides and polypeptides of the present invention can be used in assays to test for one or more biological activities. If these polynucleotides and polypeptides do exhibit activity in a particular assay, it is likely that these molecules may be involved in the diseases associated with the biological activity. Thus, the polynucleotides and polypeptides could be used to treat the associated disease.

Immune Activity

A polypeptide or polynucleotide of the present invention may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilization (chemotaxis) of immune cells. Immune cells develop through a process called hematopoiesis, producing myeloid (platelets, red blood cells, neutrophils, and macrophages) and lymphoid (B and T lymphocytes) cells from pluripotent stem cells. The etiology of these immune deficiencies or disorders may be genetic, somatic, such as cancer or some autoimmune disorders, acquired (e.g., by chemotherapy or toxins), or infectious. Moreover, a polynucleotide or polypeptide of the present invention can be used as a marker or detector of a particular immune system disease or disorder.

5 A polynucleotide or polypeptide of the present invention may be useful in
treating or detecting deficiencies or disorders of hematopoietic cells. A
10 polypeptide or polynucleotide of the present invention could be used to increase
differentiation and proliferation of hematopoietic cells, including the pluripotent stem
5 cells, in an effort to treat those disorders associated with a decrease in certain (or
many) types hematopoietic cells. Examples of immunologic deficiency syndromes
15 include, but are not limited to: blood protein disorders (e.g. agammaglobulinemia,
dysgammaglobulinemia), ataxia telangiectasia, common variable immunodeficiency,
DiGeorge Syndrome, HIV infection, HTLV-BLV infection, leukocyte adhesion
20 deficiency syndrome, lymphopenia, phagocyte bactericidal dysfunction, severe
combined immunodeficiency (SCIDs), Wiskott-Aldrich Disorder, anemia,
thrombocytopenia, or hemoglobinuria.

25 Moreover, a polypeptide or polynucleotide of the present invention could also
be used to modulate hemostatic (the stopping of bleeding) or thrombolytic activity
15 (clot formation). For example, by increasing hemostatic or thrombolytic activity, a
polynucleotide or polypeptide of the present invention could be used to treat blood
coagulation disorders (e.g., afibrinogenemia, factor deficiencies), blood platelet
30 disorders (e.g. thrombocytopenia), or wounds resulting from trauma, surgery, or other
causes. Alternatively, a polynucleotide or polypeptide of the present invention that
20 can decrease hemostatic or thrombolytic activity could be used to inhibit or dissolve
clotting. These molecules could be important in the treatment of heart attacks
35 (infarction), strokes, or scarring.

40 A polynucleotide or polypeptide of the present invention may also be useful in
treating or detecting autoimmune disorders. Many autoimmune disorders result from
25 inappropriate recognition of self as foreign material by immune cells. This
inappropriate recognition results in an immune response leading to the destruction of
the host tissue. Therefore, the administration of a polypeptide or polynucleotide of the
45 present invention that inhibits an immune response, particularly the proliferation,
differentiation, or chemotaxis of T-cells, may be an effective therapy in preventing
30 autoimmune disorders.

50 Examples of autoimmune disorders that can be treated or detected by the
present invention include, but are not limited to: Addison's Disease, hemolytic

anemia, antiphospholipid syndrome, rheumatoid arthritis, dermatitis, allergic encephalomyelitis, glomerulonephritis, Goodpasture's Syndrome, Graves' Disease, Multiple Sclerosis, Myasthenia Gravis, Neuritis, Ophthalmia, Bullous Pemphigoid, Pemphigus, Polyendocrinopathies, Purpura, Reiter's Disease, Stiff-Man Syndrome, Autoimmune Thyroiditis, Systemic Lupus Erythematosus, Autoimmune Pulmonary Inflammation, Guillain-Barre Syndrome, insulin dependent diabetes mellitus, and autoimmune inflammatory eye disease.

Similarly, allergic reactions and conditions, such as asthma (particularly allergic asthma) or other respiratory problems, may also be treated by a polypeptide or polynucleotide of the present invention. Moreover, these molecules can be used to treat anaphylaxis, hypersensitivity to an antigenic molecule, or blood group incompatibility.

A polynucleotide or polypeptide of the present invention may also be used to treat and/or prevent organ rejection or graft-versus-host disease (GVHD). Organ rejection occurs by host immune cell destruction of the transplanted tissue through an immune response. Similarly, an immune response is also involved in GVHD, but, in this case, the foreign transplanted immune cells destroy the host tissues. The administration of a polypeptide or polynucleotide of the present invention that inhibits an immune response, particularly the proliferation, differentiation, or chemotaxis of T-cells, may be an effective therapy in preventing organ rejection or GVHD.

Similarly, a polypeptide or polynucleotide of the present invention may also be used to modulate inflammation. For example, the polypeptide or polynucleotide may inhibit the proliferation and differentiation of cells involved in an inflammatory response. These molecules can be used to treat inflammatory conditions, both chronic and acute conditions, including inflammation associated with infection (e.g., septic shock, sepsis, or systemic inflammatory response syndrome (SIRS)), ischemia-reperfusion injury, endotoxin lethality, arthritis, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, Crohn's disease, or resulting from over production of cytokines (e.g., TNF or IL-1.)

Hyperproliferative Disorders

5 A polypeptide or polynucleotide can be used to treat or detect
hyperproliferative disorders, including neoplasms. A polypeptide or polynucleotide
10 of the present invention may inhibit the proliferation of the disorder through direct or
indirect interactions. Alternatively, a polypeptide or polynucleotide of the present
5 invention may proliferate other cells which can inhibit the hyperproliferative disorder.

15 For example, by increasing an immune response, particularly increasing
antigenic qualities of the hyperproliferative disorder or by proliferating,
differentiating, or mobilizing T-cells, hyperproliferative disorders can be treated.
This immune response may be increased by either enhancing an existing immune
20 response, or by initiating a new immune response. Alternatively, decreasing an
immune response may also be a method of treating hyperproliferative disorders, such
as a chemotherapeutic agent.

25 Examples of hyperproliferative disorders that can be treated or detected by a
polynucleotide or polypeptide of the present invention include, but are not limited to
15 neoplasms located in the: abdomen, bone, breast, digestive system, liver, pancreas,
peritoneum, endocrine glands (adrenal, parathyroid, pituitary, testicles, ovary, thymus,
thyroid), eye, head and neck, nervous (central and peripheral), lymphatic system,
30 pelvic, skin, soft tissue, spleen, thoracic, and urogenital.

Similarly, other hyperproliferative disorders can also be treated or detected by
20 a polynucleotide or polypeptide of the present invention. Examples of such
hyperproliferative disorders include, but are not limited to:
35 hypergammaglobulinemia, lymphoproliferative disorders, paraproteinemias, purpura,
sarcoidosis, Sezary Syndrome, Waldenström's Macroglobulinemia, Gaucher's
Disease, histiocytosis, and any other hyperproliferative disease, besides neoplasia,
40 located in an organ system listed above.

Infectious Disease

45 A polypeptide or polynucleotide of the present invention can be used to treat
or detect infectious agents. For example, by increasing the immune response,
30 particularly increasing the proliferation and differentiation of B and/or T cells,
infectious diseases may be treated. The immune response may be increased by either
50 enhancing an existing immune response, or by initiating a new immune response.

Alternatively, the polypeptide or polynucleotide of the present invention may also directly inhibit the infectious agent, without necessarily eliciting an immune response.

Viruses are one example of an infectious agent that can cause disease or symptoms that can be treated or detected by a polynucleotide or polypeptide of the present invention. Examples of viruses, include, but are not limited to the following DNA and RNA viral families: Arbovirus, Adenoviridae, Arenaviridae, Arterivirus, Birnaviridae, Bunyaviridae, Caliciviridae, Circoviridae, Coronaviridae, Flaviviridae, Hepadnaviridae (Hepatitis), Herpesviridae (such as, Cytomegalovirus, Herpes Simplex, Herpes Zoster), Mononegavirus (e.g., Paramyxoviridae, Morbillivirus, Rhabdoviridae), Orthomyxoviridae (e.g., Influenza), Papovaviridae, Parvoviridae, Picornaviridae, Poxviridae (such as Smallpox or Vaccinia), Reoviridae (e.g., Rotavirus), Retroviridae (HTLV-I, HTLV-II, Lentivirus), and Togaviridae (e.g., Rubivirus). Viruses falling within these families can cause a variety of diseases or symptoms, including, but not limited to: arthritis, bronchiolitis, encephalitis, eye infections (e.g., conjunctivitis, keratitis), chronic fatigue syndrome, hepatitis (A, B, C, E, Chronic Active, Delta), meningitis, opportunistic infections (e.g., AIDS), pneumonia, Burkitt's Lymphoma, chickenpox, hemorrhagic fever, Measles, Mumps, Parainfluenza, Rabies, the common cold, Polio, leukemia, Rubella, sexually transmitted diseases, skin diseases (e.g., Kaposi's, warts), and viremia. A polypeptide or polynucleotide of the present invention can be used to treat or detect any of these symptoms or diseases.

Similarly, bacterial or fungal agents that can cause disease or symptoms and that can be treated or detected by a polynucleotide or polypeptide of the present invention include, but not limited to, the following Gram-Negative and Gram-positive bacterial families and fungi: Actinomycetales (e.g., Corynebacterium, Mycobacterium, Nocardia), Aspergillosis, Bacillaceae (e.g., Anthrax, Clostridium), Bacteroidaceae, Blastomycosis, Bordetella, Borrelia, Brucellosis, Candidiasis, Campylobacter, Coccidioidomycosis, Cryptococcosis, Dermatocycoses, Enterobacteriaceae (Klebsiella, Salmonella, Serratia, Yersinia), Erysipelothrix, Helicobacter, Legionellosis, Leptospirosis, Listeria, Mycoplasmales, Neisseriaceae (e.g., Acinetobacter, Gonorrhea, Meningococcal), Pasteurellaceae Infections (e.g., Actinobacillus, Haemophilus, Pasteurella), Pseudomonas, Rickettsiaceae,

Chlamydiaceae, Syphilis, and Staphylococcal. These bacterial or fungal families can cause the following diseases or symptoms, including, but not limited to: bacteremia, endocarditis, eye infections (conjunctivitis, tuberculosis, uveitis), gingivitis, opportunistic infections (e.g., AIDS related infections), paronychia, prosthesis-related infections, Reiter's Disease, respiratory tract infections, such as Whooping Cough or Empyema, sepsis, Lyme Disease, Cat-Scratch Disease, Dysentery, Paratyphoid Fever, food poisoning, Typhoid, pneumonia, Gonorrhea, meningitis, Chlamydia, Syphilis, Diphtheria, Leprosy, Paratuberculosis, Tuberculosis, Lupus, Botulism, gangrene, tetanus, impetigo, Rheumatic Fever, Scarlet Fever, sexually transmitted diseases, skin diseases (e.g., cellulitis, dermatocycoses), toxemia, urinary tract infections, wound infections. A polypeptide or polynucleotide of the present invention can be used to treat or detect any of these symptoms or diseases.

Moreover, parasitic agents causing disease or symptoms that can be treated or detected by a polynucleotide or polypeptide of the present invention include, but not limited to, the following families: Amebiasis, Babesiosis, Coccidiosis, Cryptosporidiosis, Dientamoebiasis, Dourine, Ectoparasitic, Giardiasis, Helminthiasis, Leishmaniasis, Theileriasis, Toxoplasmosis, Trypanosomiasis, and Trichomonas. These parasites can cause a variety of diseases or symptoms, including, but not limited to: Scabies, Trombiculiasis, eye infections, intestinal disease (e.g., dysentery, giardiasis), liver disease, lung disease, opportunistic infections (e.g., AIDS related), Malaria, pregnancy complications, and toxoplasmosis. A polypeptide or polynucleotide of the present invention can be used to treat or detect any of these symptoms or diseases.

Preferably, treatment using a polypeptide or polynucleotide of the present invention could either be by administering an effective amount of a polypeptide to the patient, or by removing cells from the patient, supplying the cells with a polynucleotide of the present invention, and returning the engineered cells to the patient (ex vivo therapy). Moreover, the polypeptide or polynucleotide of the present invention can be used as an antigen in a vaccine to raise an immune response against infectious disease.

Regeneration

5 A polynucleotide or polypeptide of the present invention can be used to
differentiate, proliferate, and attract cells, leading to the regeneration of tissues. (See,
10 Science 276:59-87 (1997).) The regeneration of tissues could be used to repair,
replace, or protect tissue damaged by congenital defects, trauma (wounds, burns,
5 incisions, or ulcers), age, disease (e.g. osteoporosis, osteoarthritis, periodontal
disease, liver failure), surgery, including cosmetic plastic surgery, fibrosis,
15 reperfusion injury, or systemic cytokine damage.

Tissues that could be regenerated using the present invention include organs
(e.g., pancreas, liver, intestine, kidney, skin, endothelium), muscle (smooth, skeletal
20 or cardiac), vasculature (including vascular and lymphatics), nervous, hematopoietic,
10 and skeletal (bone, cartilage, tendon, and ligament) tissue. Preferably, regeneration
occurs without or decreased scarring. Regeneration also may include angiogenesis.

Moreover, a polynucleotide or polypeptide of the present invention may
25 increase regeneration of tissues difficult to heal. For example, increased
15 tendon/ligament regeneration would quicken recovery time after damage. A
polynucleotide or polypeptide of the present invention could also be used
prophylactically in an effort to avoid damage. Specific diseases that could be treated
30 include of tendinitis, carpal tunnel syndrome, and other tendon or ligament defects. A
further example of tissue regeneration of non-healing wounds includes pressure
20 ulcers, ulcers associated with vascular insufficiency, surgical, and traumatic wounds.

35 Similarly, nerve and brain tissue could also be regenerated by using a
polynucleotide or polypeptide of the present invention to proliferate and differentiate
nerve cells. Diseases that could be treated using this method include central and
peripheral nervous system diseases, neuropathies, or mechanical and traumatic
40 25 disorders (e.g., spinal cord disorders, head trauma, cerebrovascular disease, and
stroke). Specifically, diseases associated with peripheral nerve injuries, peripheral
neuropathy (e.g., resulting from chemotherapy or other medical therapies), localized
45 neuropathies, and central nervous system diseases (e.g., Alzheimer's disease,
Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-
30 Drager syndrome), could all be treated using the polynucleotide or polypeptide of the
present invention.

Chemotaxis

A polynucleotide or polypeptide of the present invention may have chemotaxis activity. A chemotactic molecule attracts or mobilizes cells (e.g., monocytes, fibroblasts, neutrophils, T-cells, mast cells, eosinophils, epithelial and/or endothelial cells) to a particular site in the body, such as inflammation, infection, or site of hyperproliferation. The mobilized cells can then fight off and/or heal the particular trauma or abnormality.

A polynucleotide or polypeptide of the present invention may increase chemotactic activity of particular cells. These chemotactic molecules can then be used to treat inflammation, infection, hyperproliferative disorders, or any immune system disorder by increasing the number of cells targeted to a particular location in the body. For example, chemotactic molecules can be used to treat wounds and other trauma to tissues by attracting immune cells to the injured location. Chemotactic molecules of the present invention can also attract fibroblasts, which can be used to treat wounds.

It is also contemplated that a polynucleotide or polypeptide of the present invention may inhibit chemotactic activity. These molecules could also be used to treat disorders. Thus, a polynucleotide or polypeptide of the present invention could be used as an inhibitor of chemotaxis.

Binding Activity

A polypeptide of the present invention may be used to screen for molecules that bind to the polypeptide or for molecules to which the polypeptide binds. The binding of the polypeptide and the molecule may activate (agonist), increase, inhibit (antagonist), or decrease activity of the polypeptide or the molecule bound. Examples of such molecules include antibodies, oligonucleotides, proteins (e.g., receptors), or small molecules.

Preferably, the molecule is closely related to the natural ligand of the polypeptide, e.g., a fragment of the ligand, or a natural substrate, a ligand, a structural or functional mimetic. (See, Coligan et al., Current Protocols in Immunology 1(2):Chapter 5 (1991).) Similarly, the molecule can be closely related to the natural receptor to which the polypeptide binds, or at least, a fragment of the receptor capable

of being bound by the polypeptide (e.g., active site). In either case, the molecule can be rationally designed using known techniques.

Preferably, the screening for these molecules involves producing appropriate cells which express the polypeptide, either as a secreted protein or on the cell membrane. Preferred cells include cells from mammals, yeast, *Drosophila*, or *E. coli*. Cells expressing the polypeptide (or cell membrane containing the expressed polypeptide) are then preferably contacted with a test compound potentially containing the molecule to observe binding, stimulation, or inhibition of activity of either the polypeptide or the molecule.

The assay may simply test binding of a candidate compound to the polypeptide, wherein binding is detected by a label, or in an assay involving competition with a labeled competitor. Further, the assay may test whether the candidate compound results in a signal generated by binding to the polypeptide.

Alternatively, the assay can be carried out using cell-free preparations, polypeptide/molecule affixed to a solid support, chemical libraries, or natural product mixtures. The assay may also simply comprise the steps of mixing a candidate compound with a solution containing a polypeptide, measuring polypeptide/molecule activity or binding, and comparing the polypeptide/molecule activity or binding to a standard.

Preferably, an ELISA assay can measure polypeptide level or activity in a sample (e.g., biological sample) using a monoclonal or polyclonal antibody. The antibody can measure polypeptide level or activity by either binding, directly or indirectly, to the polypeptide or by competing with the polypeptide for a substrate.

All of these above assays can be used as diagnostic or prognostic markers.

The molecules discovered using these assays can be used to treat disease or to bring about a particular result in a patient (e.g., blood vessel growth) by activating or inhibiting the polypeptide/molecule. Moreover, the assays can discover agents which may inhibit or enhance the production of the polypeptide from suitably manipulated cells or tissues.

Therefore, the invention includes a method of identifying compounds which bind to a polypeptide of the invention comprising the steps of: (a) incubating a

5 candidate binding compound with a polypeptide of the invention; and (b) determining
if binding has occurred. Moreover, the invention includes a method of identifying
10 agonists/antagonists comprising the steps of: (a) incubating a candidate compound
with a polypeptide of the invention, (b) assaying a biological activity, and (b)
5 determining if a biological activity of the polypeptide has been altered.

15 Other Activities

A polypeptide or polynucleotide of the present invention may also increase or
decrease the differentiation or proliferation of embryonic stem cells, besides, as
10 discussed above, hematopoietic lineage.

20 A polypeptide or polynucleotide of the present invention may also be used to
modulate mammalian characteristics, such as body height, weight, hair color, eye
color, skin, percentage of adipose tissue, pigmentation, size, and shape (e.g., cosmetic
surgery). Similarly, a polypeptide or polynucleotide of the present invention may be
25 used to modulate mammalian metabolism affecting catabolism, anabolism,
15 processing, utilization, and storage of energy.

30 A polypeptide or polynucleotide of the present invention may be used to
change a mammal's mental state or physical state by influencing biorhythms,
cardiac rhythms, depression (including depressive disorders), tendency for violence,
20 tolerance for pain, reproductive capabilities (preferably by Activin or Inhibin-like
activity), hormonal or endocrine levels, appetite, libido, memory, stress, or other
35 cognitive qualities.

40 A polypeptide or polynucleotide of the present invention may also be used as a
25 food additive or preservative, such as to increase or decrease storage capabilities, fat
content, lipid, protein, carbohydrate, vitamins, minerals, cofactors or other nutritional
components.

45 Other Preferred Embodiments

Other preferred embodiments of the claimed invention include an isolated
30 nucleic acid molecule comprising a nucleotide sequence which is at least 95%
identical to a sequence of at least about 50 contiguous nucleotides in the nucleotide
50 sequence of SEQ ID NO:X wherein X is any integer as defined in Table 1.

5

10

Also preferred is a nucleic acid molecule wherein said sequence of contiguous nucleotides is included in the nucleotide sequence of SEQ ID NO:X in the range of positions beginning with the nucleotide at about the position of the 5' Nucleotide of the Clone Sequence and ending with the nucleotide at about the position of the 3'

5 Nucleotide of the Clone Sequence as defined for SEQ ID NO:X in Table 1.

15

Also preferred is a nucleic acid molecule wherein said sequence of contiguous nucleotides is included in the nucleotide sequence of SEQ ID NO:X in the range of positions beginning with the nucleotide at about the position of the 5' Nucleotide of the Start Codon and ending with the nucleotide at about the position of the 3'

20

10 Nucleotide of the Clone Sequence as defined for SEQ ID NO:X in Table 1.

25

Similarly preferred is a nucleic acid molecule wherein said sequence of contiguous nucleotides is included in the nucleotide sequence of SEQ ID NO:X in the range of positions beginning with the nucleotide at about the position of the 5' Nucleotide of the First Amino Acid of the Signal Peptide and ending with the nucleotide at about the position of the 3' Nucleotide of the Clone Sequence as defined for SEQ ID NO:X in Table 1.

30

Also preferred is an isolated nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to a sequence of at least about 150 contiguous nucleotides in the nucleotide sequence of SEQ ID NO:X.

35

20 Further preferred is an isolated nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to a sequence of at least about 500 contiguous nucleotides in the nucleotide sequence of SEQ ID NO:X.

40

A further preferred embodiment is a nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to the nucleotide sequence of SEQ ID NO:X beginning with the nucleotide at about the position of the 5' Nucleotide of the First Amino Acid of the Signal Peptide and ending with the nucleotide at about the position of the 3' Nucleotide of the Clone Sequence as defined for SEQ ID NO:X in Table 1.

45

A further preferred embodiment is an isolated nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to the complete nucleotide sequence of SEQ ID NO:X.

50

55

5

10

Also preferred is an isolated nucleic acid molecule which hybridizes under stringent hybridization conditions to a nucleic acid molecule, wherein said nucleic acid molecule which hybridizes does not hybridize under stringent hybridization conditions to a nucleic acid molecule having a nucleotide sequence consisting of only A residues or of only T residues.

15

20

Also preferred is a composition of matter comprising a DNA molecule which comprises a human cDNA clone identified by a cDNA Clone Identifier in Table 1, which DNA molecule is contained in the material deposited with the American Type Culture Collection and given the ATCC Deposit Number shown in Table 1 for said cDNA Clone Identifier.

25

30

Also preferred is an isolated nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to a sequence of at least 50 contiguous nucleotides in the nucleotide sequence of a human cDNA clone identified by a cDNA Clone Identifier in Table 1, which DNA molecule is contained in the deposit given the ATCC Deposit Number shown in Table 1.

35

40

Also preferred is an isolated nucleic acid molecule, wherein said sequence of at least 50 contiguous nucleotides is included in the nucleotide sequence of the complete open reading frame sequence encoded by said human cDNA clone.

Also preferred is an isolated nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to sequence of at least 150 contiguous nucleotides in the nucleotide sequence encoded by said human cDNA clone.

A further preferred embodiment is an isolated nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to sequence of at least 500 contiguous nucleotides in the nucleotide sequence encoded by said human cDNA clone.

45

50

A further preferred embodiment is an isolated nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to the complete nucleotide sequence encoded by said human cDNA clone.

A further preferred embodiment is a method for detecting in a biological sample a nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to a sequence of at least 50 contiguous nucleotides in a sequence selected from the group consisting of: a nucleotide sequence of SEQ ID NO:X

55

5 wherein X is any integer as defined in Table 1; and a nucleotide sequence encoded by
a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained
10 in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table
1; which method comprises a step of comparing a nucleotide sequence of at least one
5 nucleic acid molecule in said sample with a sequence selected from said group and
determining whether the sequence of said nucleic acid molecule in said sample is at
15 least 95% identical to said selected sequence.

Also preferred is the above method wherein said step of comparing sequences
comprises determining the extent of nucleic acid hybridization between nucleic acid
20 molecules in said sample and a nucleic acid molecule comprising said sequence
selected from said group. Similarly, also preferred is the above method wherein said
step of comparing sequences is performed by comparing the nucleotide sequence
determined from a nucleic acid molecule in said sample with said sequence selected
25 from said group. The nucleic acid molecules can comprise DNA molecules or RNA
15 molecules.

A further preferred embodiment is a method for identifying the species, tissue
or cell type of a biological sample which method comprises a step of detecting nucleic
30 acid molecules in said sample, if any, comprising a nucleotide sequence that is at least
95% identical to a sequence of at least 50 contiguous nucleotides in a sequence
20 selected from the group consisting of: a nucleotide sequence of SEQ ID NO:X
wherein X is any integer as defined in Table 1; and a nucleotide sequence encoded by
35 a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained
in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table
1.

40 25 The method for identifying the species, tissue or cell type of a biological
sample can comprise a step of detecting nucleic acid molecules comprising a
nucleotide sequence in a panel of at least two nucleotide sequences, wherein at least
45 one sequence in said panel is at least 95% identical to a sequence of at least 50
contiguous nucleotides in a sequence selected from said group.

30 50 Also preferred is a method for diagnosing in a subject a pathological condition
associated with abnormal structure or expression of a gene encoding a secreted
protein identified in Table 1, which method comprises a step of detecting in a

5 biological sample obtained from said subject nucleic acid molecules, if any,
comprising a nucleotide sequence that is at least 95% identical to a sequence of at
10 least 50 contiguous nucleotides in a sequence selected from the group consisting of: a
nucleotide sequence of SEQ ID NO:X wherein X is any integer as defined in Table 1;
5 and a nucleotide sequence encoded by a human cDNA clone identified by a cDNA
Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit
15 Number shown for said cDNA clone in Table 1.

The method for diagnosing a pathological condition can comprise a step of
detecting nucleic acid molecules comprising a nucleotide sequence in a panel of at
20 10 least two nucleotide sequences, wherein at least one sequence in said panel is at least
95% identical to a sequence of at least 50 contiguous nucleotides in a sequence
selected from said group.

Also preferred is a composition of matter comprising isolated nucleic acid
25 molecules wherein the nucleotide sequences of said nucleic acid molecules comprise
15 a panel of at least two nucleotide sequences, wherein at least one sequence in said
panel is at least 95% identical to a sequence of at least 50 contiguous nucleotides in a
sequence selected from the group consisting of: a nucleotide sequence of SEQ ID
30 NO:X wherein X is any integer as defined in Table 1; and a nucleotide sequence
encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1
20 and contained in the deposit with the ATCC Deposit Number shown for said cDNA
clone in Table 1. The nucleic acid molecules can comprise DNA molecules or RNA
35 molecules.

Also preferred is an isolated polypeptide comprising an amino acid sequence
at least 90% identical to a sequence of at least about 10 contiguous amino acids in the
40 25 amino acid sequence of SEQ ID NO:Y wherein Y is any integer as defined in Table 1.

Also preferred is a polypeptide, wherein said sequence of contiguous amino
acids is included in the amino acid sequence of SEQ ID NO:Y in the range of
45 positions beginning with the residue at about the position of the First Amino Acid of
the Secreted Portion and ending with the residue at about the Last Amino Acid of the
30 Open Reading Frame as set forth for SEQ ID NO:Y in Table 1.

5

Also preferred is an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence of at least about 30 contiguous amino acids in the amino acid sequence of SEQ ID NO:Y.

10

Further preferred is an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence of at least about 100 contiguous amino acids in the amino acid sequence of SEQ ID NO:Y.

5

15

Further preferred is an isolated polypeptide comprising an amino acid sequence at least 95% identical to the complete amino acid sequence of SEQ ID NO:Y.

20

10

Further preferred is an isolated polypeptide comprising an amino acid sequence at least 90% identical to a sequence of at least about 10 contiguous amino acids in the complete amino acid sequence of a secreted protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

25

15

Also preferred is a polypeptide wherein said sequence of contiguous amino acids is included in the amino acid sequence of a secreted portion of the secreted protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

30

20

Also preferred is an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence of at least about 30 contiguous amino acids in the amino acid sequence of the secreted portion of the protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

35

40

25

Also preferred is an isolated polypeptide comprising an amino acid sequence at least 95% identical to a sequence of at least about 100 contiguous amino acids in the amino acid sequence of the secreted portion of the protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

45

30

Also preferred is an isolated polypeptide comprising an amino acid sequence at least 95% identical to the amino acid sequence of the secreted portion of the protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1

50

55

and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

Further preferred is an isolated antibody which binds specifically to a polypeptide comprising an amino acid sequence that is at least 90% identical to a sequence of at least 10 contiguous amino acids in a sequence selected from the group consisting of: an amino acid sequence of SEQ ID NO:Y wherein Y is any integer as defined in Table 1; and a complete amino acid sequence of a protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

Further preferred is a method for detecting in a biological sample a polypeptide comprising an amino acid sequence which is at least 90% identical to a sequence of at least 10 contiguous amino acids in a sequence selected from the group consisting of: an amino acid sequence of SEQ ID NO:Y wherein Y is any integer as defined in Table 1; and a complete amino acid sequence of a protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1; which method comprises a step of comparing an amino acid sequence of at least one polypeptide molecule in said sample with a sequence selected from said group and determining whether the sequence of said polypeptide molecule in said sample is at least 90% identical to said sequence of at least 10 contiguous amino acids.

Also preferred is the above method wherein said step of comparing an amino acid sequence of at least one polypeptide molecule in said sample with a sequence selected from said group comprises determining the extent of specific binding of polypeptides in said sample to an antibody which binds specifically to a polypeptide comprising an amino acid sequence that is at least 90% identical to a sequence of at least 10 contiguous amino acids in a sequence selected from the group consisting of: an amino acid sequence of SEQ ID NO:Y wherein Y is any integer as defined in Table 1; and a complete amino acid sequence of a protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

Also preferred is the above method wherein said step of comparing sequences is performed by comparing the amino acid sequence determined from a polypeptide molecule in said sample with said sequence selected from said group.

Also preferred is a method for identifying the species, tissue or cell type of a biological sample which method comprises a step of detecting polypeptide molecules in said sample, if any, comprising an amino acid sequence that is at least 90% identical to a sequence of at least 10 contiguous amino acids in a sequence selected from the group consisting of: an amino acid sequence of SEQ ID NO:Y wherein Y is any integer as defined in Table 1; and a complete amino acid sequence of a secreted protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

Also preferred is the above method for identifying the species, tissue or cell type of a biological sample, which method comprises a step of detecting polypeptide molecules comprising an amino acid sequence in a panel of at least two amino acid sequences, wherein at least one sequence in said panel is at least 90% identical to a sequence of at least 10 contiguous amino acids in a sequence selected from the above group.

Also preferred is a method for diagnosing in a subject a pathological condition associated with abnormal structure or expression of a gene encoding a secreted protein identified in Table 1, which method comprises a step of detecting in a biological sample obtained from said subject polypeptide molecules comprising an amino acid sequence in a panel of at least two amino acid sequences, wherein at least one sequence in said panel is at least 90% identical to a sequence of at least 10 contiguous amino acids in a sequence selected from the group consisting of: an amino acid sequence of SEQ ID NO:Y wherein Y is any integer as defined in Table 1; and a complete amino acid sequence of a secreted protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

In any of these methods, the step of detecting said polypeptide molecules includes using an antibody.

Also preferred is an isolated nucleic acid molecule comprising a nucleotide sequence which is at least 95% identical to a nucleotide sequence encoding a polypeptide wherein said polypeptide comprises an amino acid sequence that is at least 90% identical to a sequence of at least 10 contiguous amino acids in a sequence selected from the group consisting of: an amino acid sequence of SEQ ID NO:Y wherein Y is any integer as defined in Table 1; and a complete amino acid sequence of a secreted protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

Also preferred is an isolated nucleic acid molecule, wherein said nucleotide sequence encoding a polypeptide has been optimized for expression of said polypeptide in a prokaryotic host.

Also preferred is an isolated nucleic acid molecule, wherein said polypeptide comprises an amino acid sequence selected from the group consisting of: an amino acid sequence of SEQ ID NO:Y wherein Y is any integer as defined in Table 1; and a complete amino acid sequence of a secreted protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1.

Further preferred is a method of making a recombinant vector comprising inserting any of the above isolated nucleic acid molecule into a vector. Also preferred is the recombinant vector produced by this method. Also preferred is a method of making a recombinant host cell comprising introducing the vector into a host cell, as well as the recombinant host cell produced by this method.

Also preferred is a method of making an isolated polypeptide comprising culturing this recombinant host cell under conditions such that said polypeptide is expressed and recovering said polypeptide. Also preferred is this method of making an isolated polypeptide, wherein said recombinant host cell is a eukaryotic cell and said polypeptide is a secreted portion of a human secreted protein comprising an amino acid sequence selected from the group consisting of: an amino acid sequence of SEQ ID NO:Y beginning with the residue at the position of the First Amino Acid of the Secreted Portion of SEQ ID NO:Y wherein Y is an integer set forth in Table 1 and said position of the First Amino Acid of the Secreted Portion of SEQ ID NO:Y is

defined in Table 1; and an amino acid sequence of a secreted portion of a protein encoded by a human cDNA clone identified by a cDNA Clone Identifier in Table 1 and contained in the deposit with the ATCC Deposit Number shown for said cDNA clone in Table 1. The isolated polypeptide produced by this method is also preferred.

Also preferred is a method of treatment of an individual in need of an increased level of a secreted protein activity, which method comprises administering to such an individual a pharmaceutical composition comprising an amount of an isolated polypeptide, polynucleotide, or antibody of the claimed invention effective to increase the level of said protein activity in said individual.

Having generally described the invention, the same will be more readily understood by reference to the following examples, which are provided by way of illustration and are not intended as limiting.

Examples

Example 1: Isolation of a Selected cDNA Clone From the Deposited Sample

Each cDNA clone in a cited ATCC deposit is contained in a plasmid vector. Table 1 identifies the vectors used to construct the cDNA library from which each clone was isolated. In many cases, the vector used to construct the library is a phage vector from which a plasmid has been excised. The table immediately below correlates the related plasmid for each phage vector used in constructing the cDNA library. For example, where a particular clone is identified in Table 1 as being isolated in the vector "Lambda Zap," the corresponding deposited clone is in "pBluescript."

<u>Vector Used to Construct Library</u>	<u>Corresponding Deposited</u>
<u>Plasmid</u>	
Lambda Zap	pBluescript (pBS)
Uni-Zap XR	pBluescript (pBS)
Zap Express	pBK
lafmid BA	plafmid BA
pSport1	pSport1
pCMVSport 2.0	pCMVSport 2.0

pCMVSPORT 3.0

pCMVSPORT 3.0

pCR[®]2.1pCR[®]2.1

Vectors Lambda Zap (U.S. Patent Nos. 5,128,256 and 5,286,636), Uni-Zap XR (U.S. Patent Nos. 5,128, 256 and 5,286,636), Zap Express (U.S. Patent Nos. 5,128,256 and 5,286,636), pBluescript (pBS) (Short, J. M. et al., Nucleic Acids Res. 16:7583-7600 (1988); Altung-Mees, M. A. and Short, J. M., Nucleic Acids Res. 17:9494 (1989)) and pBK (Altung-Mees, M. A. et al., Strategies 5:58-61 (1992)) are commercially available from Stratagene Cloning Systems, Inc., 11011 N. Torrey Pines Road, La Jolla, CA, 92037. pBS contains an ampicillin resistance gene and pBK contains a neomycin resistance gene. Both can be transformed into E. coli strain XL-1 Blue, also available from Stratagene. pBS comes in 4 forms SK+, SK-, KS+ and KS-. The S and K-refers to the orientation of the polylinker to the T7 and T3 primer sequences which flank the polylinker region ("S" is for SacI and "K" is for KpnI which are the first sites on each respective end of the linker). "+" or "-" refer to the orientation of the fl origin of replication ("ori"), such that in one orientation, single stranded rescue initiated from the fl ori generates sense strand DNA and in the other, antisense.

Vectors pSPORT1, pCMVSPORT 2.0 and pCMVSPORT 3.0, were obtained from Life Technologies, Inc., P. O. Box 6009, Gaithersburg, MD 20897. All Sport vectors contain an ampicillin resistance gene and may be transformed into E. coli strain DH10B, also available from Life Technologies. (See, for instance, Gruber, C. E., et al., Focus 15:59 (1993).) Vector lacmid BA (Bento Soares, Columbia University, NY) contains an ampicillin resistance gene and can be transformed into E. coli strain XL-1 Blue. Vector pCR[®]2.1, which is available from Invitrogen, 1600 Faraday Avenue, Carlsbad, CA 92008, contains an ampicillin resistance gene and may be transformed into E. coli strain DH10B, available from Life Technologies. (See, for instance, Clark, J. M., Nuc. Acids Res. 16:9677-9686 (1988) and Mead, D. et al., Bio/Technology 9: (1991).) Preferably, a polynucleotide of the present invention does not comprise the phage vector sequences identified for the particular clone in Table 1, as well as the corresponding plasmid vector sequences designated above.

The deposited material in the sample assigned the ATCC Deposit Number cited in Table 1 for any given cDNA clone also may contain one or more additional

5
10
15
plasmids, each comprising a cDNA clone different from that given clone. Thus, deposits sharing the same ATCC Deposit Number contain at least a plasmid for each cDNA clone identified in Table 1. Typically, each ATCC deposit sample cited in Table 1 comprises a mixture of approximately equal amounts (by weight) of about 50 plasmid DNAs, each containing a different cDNA clone; but such a deposit sample may include plasmids for more or less than 50 cDNA clones, up to about 500 cDNA clones.

20
Two approaches can be used to isolate a particular clone from the deposited sample of plasmid DNAs cited for that clone in Table 1. First, a plasmid is directly isolated by screening the clones using a polynucleotide probe corresponding to SEQ ID NO:X.

25
30
35
40
45
50
55
Particularly, a specific polynucleotide with 30-40 nucleotides is synthesized using an Applied Biosystems DNA synthesizer according to the sequence reported. The oligonucleotide is labeled, for instance, with ³²P-γ-ATP using T4 polynucleotide kinase and purified according to routine methods. (E.g., Maniatis et al., *Molecular Cloning: A Laboratory Manual*, Cold Spring Harbor Press, Cold Spring, NY (1982).) The plasmid mixture is transformed into a suitable host, as indicated above (such as XL-1 Blue (Stratagene)) using techniques known to those of skill in the art, such as those provided by the vector supplier or in related publications or patents cited above. The transformants are plated on 1.5% agar plates (containing the appropriate selection agent, e.g., ampicillin) to a density of about 150 transformants (colonies) per plate. These plates are screened using Nylon membranes according to routine methods for bacterial colony screening (e.g., Sambrook et al., *Molecular Cloning: A Laboratory Manual*, 2nd Edit., (1989), Cold Spring Harbor Laboratory Press, pages 1.93 to 1.104), or other techniques known to those of skill in the art.

Alternatively, two primers of 17-20 nucleotides derived from both ends of the SEQ ID NO:X (i.e., within the region of SEQ ID NO:X bounded by the 5' NT and the 3' NT of the clone defined in Table 1) are synthesized and used to amplify the desired cDNA using the deposited cDNA plasmid as a template. The polymerase chain reaction is carried out under routine conditions, for instance, in 25 μl of reaction mixture with 0.5 ug of the above cDNA template. A convenient reaction mixture is 1.5-5 mM MgCl₂, 0.01% (w/v) gelatin, 20 μM each of dATP, dCTP, dGTP, dTTP, 25

5 pmol of each primer and 0.25 Unit of Taq polymerase. Thirty five cycles of PCR
(denaturation at 94°C for 1 min; annealing at 55°C for 1 min; elongation at 72°C for 1
10 min) are performed with a Perkin-Elmer Cetus automated thermal cycler. The
amplified product is analyzed by agarose gel electrophoresis and the DNA band with
5 expected molecular weight is excised and purified. The PCR product is verified to be
the selected sequence by subcloning and sequencing the DNA product.

15 Several methods are available for the identification of the 5' or 3' non-coding
portions of a gene which may not be present in the deposited clone. These methods
include but are not limited to, filter probing, clone enrichment using specific probes,
20 and protocols similar or identical to 5' and 3' "RACE" protocols which are well
known in the art. For instance, a method similar to 5' RACE is available for
generating the missing 5' end of a desired full-length transcript. (Fromont-Racine et
al., Nucleic Acids Res. 21(7):1683-1684 (1993).)

25 Briefly, a specific RNA oligonucleotide is ligated to the 5' ends of a
15 population of RNA presumably containing full-length gene RNA transcripts. A
primer set containing a primer specific to the ligated RNA oligonucleotide and a
primer specific to a known sequence of the gene of interest is used to PCR amplify
30 the 5' portion of the desired full-length gene. This amplified product may then be
sequenced and used to generate the full length gene.

20 This above method starts with total RNA isolated from the desired source,
although poly-A+ RNA can be used. The RNA preparation can then be treated with
35 phosphatase if necessary to eliminate 5' phosphate groups on degraded or damaged
RNA which may interfere with the later RNA ligase step. The phosphatase should
then be inactivated and the RNA treated with tobacco acid pyrophosphatase in order
40 25 to remove the cap structure present at the 5' ends of messenger RNAs. This reaction
leaves a 5' phosphate group at the 5' end of the cap cleaved RNA which can then be
ligated to an RNA oligonucleotide using T4 RNA ligase.

45 This modified RNA preparation is used as a template for first strand cDNA
synthesis using a gene specific oligonucleotide. The first strand synthesis reaction is
30 used as a template for PCR amplification of the desired 5' end using a primer specific
to the ligated RNA oligonucleotide and a primer specific to the known sequence of
50

the gene of interest. The resultant product is then sequenced and analyzed to confirm that the 5' end sequence belongs to the desired gene.

Example 2: Isolation of Genomic Clones Corresponding to a Polynucleotide

A human genomic P1 library (Genomic Systems, Inc.) is screened by PCR using primers selected for the cDNA sequence corresponding to SEQ ID NO:X., according to the method described in Example 1. (See also, Sambrook.)

Example 3: Tissue Distribution of Polypeptide

Tissue distribution of mRNA expression of polynucleotides of the present invention is determined using protocols for Northern blot analysis, described by, among others, Sambrook et al. For example, a cDNA probe produced by the method described in Example 1 is labeled with P³² using the rediprime™ DNA labeling system (Amersham Life Science), according to manufacturer's instructions. After labeling, the probe is purified using CHROMA SPIN-100™ column (Clontech Laboratories, Inc.), according to manufacturer's protocol number PT1200-1. The purified labeled probe is then used to examine various human tissues for mRNA expression.

Multiple Tissue Northern (MTN) blots containing various human tissues (H) or human immune system tissues (IM) (Clontech) are examined with the labeled probe using ExpressHyb™ hybridization solution (Clontech) according to manufacturer's protocol number PT1190-1. Following hybridization and washing, the blots are mounted and exposed to film at -70°C overnight, and the films developed according to standard procedures.

Example 4: Chromosomal Mapping of the Polynucleotides

An oligonucleotide primer set is designed according to the sequence at the 5' end of SEQ ID NO:X. This primer preferably spans about 100 nucleotides. This primer set is then used in a polymerase chain reaction under the following set of conditions : 30 seconds, 95°C; 1 minute, 56°C; 1 minute, 70°C. This cycle is repeated 32 times followed by one 5 minute cycle at 70°C. Human, mouse, and hamster DNA is used as template in addition to a somatic cell hybrid panel containing

individual chromosomes or chromosome fragments (Bios, Inc). The reactions is analyzed on either 8% polyacrylamide gels or 3.5 % agarose gels. Chromosome mapping is determined by the presence of an approximately 100 bp PCR fragment in the particular somatic cell hybrid.

Example 5: Bacterial Expression of a Polypeptide

A polynucleotide encoding a polypeptide of the present invention is amplified using PCR oligonucleotide primers corresponding to the 5' and 3' ends of the DNA sequence, as outlined in Example 1, to synthesize insertion fragments. The primers used to amplify the cDNA insert should preferably contain restriction sites, such as BamHI and XbaI, at the 5' end of the primers in order to clone the amplified product into the expression vector. For example, BamHI and XbaI correspond to the restriction enzyme sites on the bacterial expression vector pQE-9. (Qiagen, Inc., Chatsworth, CA). This plasmid vector encodes antibiotic resistance (Amp^r), a bacterial origin of replication (ori), an IPTG-regulatable promoter/operator (P/O), a ribosome binding site (RBS), a 6-histidine tag (6-His), and restriction enzyme cloning sites.

The pQE-9 vector is digested with BamHI and XbaI and the amplified fragment is ligated into the pQE-9 vector maintaining the reading frame initiated at the bacterial RBS. The ligation mixture is then used to transform the E. coli strain M15/rep4 (Qiagen, Inc.) which contains multiple copies of the plasmid pREP4, which expresses the lacI repressor and also confers kanamycin resistance (Kan^r). Transformants are identified by their ability to grow on LB plates and ampicillin/kanamycin resistant colonies are selected. Plasmid DNA is isolated and confirmed by restriction analysis.

Clones containing the desired constructs are grown overnight (O/N) in liquid culture in LB media supplemented with both Amp (100 ug/ml) and Kan (25 ug/ml). The O/N culture is used to inoculate a large culture at a ratio of 1:100 to 1:250. The cells are grown to an optical density 600 (O.D.⁶⁰⁰) of between 0.4 and 0.6. IPTG (Isopropyl-B-D-thiogalacto pyranoside) is then added to a final concentration of 1

5 mM. IPTG induces by inactivating the lacI repressor, clearing the P/O leading to increased gene expression.

10 Cells are grown for an extra 3 to 4 hours. Cells are then harvested by centrifugation (20 mins at 6000Xg). The cell pellet is solubilized in the chaotropic agent 6 Molar Guanidine HCl by stirring for 3-4 hours at 4°C. The cell debris is removed by centrifugation, and the supernatant containing the polypeptide is loaded onto a nickel-nitrilo-tri-acetic acid ("Ni-NTA") affinity resin column (available from QIAGEN, Inc., *supra*). Proteins with a 6 x His tag bind to the Ni-NTA resin with high affinity and can be purified in a simple one-step procedure (for details see: The QIAexpressionist (1995) QIAGEN, Inc., *supra*).

20 Briefly, the supernatant is loaded onto the column in 6 M guanidine-HCl, pH 8, the column is first washed with 10 volumes of 6 M guanidine-HCl, pH 8, then washed with 10 volumes of 6 M guanidine-HCl pH 6, and finally the polypeptide is eluted with 6 M guanidine-HCl, pH 5.

25 The purified protein is then renatured by dialyzing it against phosphate-buffered saline (PBS) or 50 mM Na-acetate, pH 6 buffer plus 200 mM NaCl. Alternatively, the protein can be successfully refolded while immobilized on the Ni-NTA column. The recommended conditions are as follows: renature using a linear 6M-1M urea gradient in 500 mM NaCl, 20% glycerol, 20 mM Tris/HCl pH 7.4, containing protease inhibitors. The renaturation should be performed over a period of 1.5 hours or more. After renaturation the proteins are eluted by the addition of 250 mM imidazole. Imidazole is removed by a final dialyzing step against PBS or 50 mM sodium acetate pH 6 buffer plus 200 mM NaCl. The purified protein is stored at 4°C or frozen at -80°C.

40 25 In addition to the above expression vector, the present invention further includes an expression vector comprising phage operator and promoter elements operatively linked to a polynucleotide of the present invention, called pHE4a. (ATCC Accession Number 209645, deposited on February 25, 1998.) This vector contains: 45 1) a neomycinphosphotransferase gene as a selection marker. 2) an E. coli origin of replication. 3) a T5 phage promoter sequence, 4) two lac operator sequences, 5) a Shine-Delgarno sequence, and 6) the lactose operon repressor gene (lacIq). The

origin of replication (oriC) is derived from pUC19 (LTI, Gaithersburg, MD). The promoter sequence and operator sequences are made synthetically.

DNA can be inserted into the pHEa by restricting the vector with NdeI and XbaI, BamHI, XhoI, or Asp718, running the restricted product on a gel, and isolating the larger fragment (the stuffer fragment should be about 310 base pairs). The DNA insert is generated according to the PCR protocol described in Example 1, using PCR primers having restriction sites for NdeI (5' primer) and XbaI, BamHI, XhoI, or Asp718 (3' primer). The PCR insert is gel purified and restricted with compatible enzymes. The insert and vector are ligated according to standard protocols.

The engineered vector could easily be substituted in the above protocol to express protein in a bacterial system.

Example 6: Purification of a Polypeptide from an Inclusion Body

The following alternative method can be used to purify a polypeptide expressed in *E. coli* when it is present in the form of inclusion bodies. Unless otherwise specified, all of the following steps are conducted at 4-10°C.

Upon completion of the production phase of the *E. coli* fermentation, the cell culture is cooled to 4-10°C and the cells harvested by continuous centrifugation at 15,000 rpm (Heraeus Sepatech). On the basis of the expected yield of protein per unit weight of cell paste and the amount of purified protein required, an appropriate amount of cell paste, by weight, is suspended in a buffer solution containing 100 mM Tris, 50 mM EDTA, pH 7.4. The cells are dispersed to a homogeneous suspension using a high shear mixer.

The cells are then lysed by passing the solution through a microfluidizer (Microfluidics, Corp. or APV Gaulin, Inc.) twice at 4000-6000 psi. The homogenate is then mixed with NaCl solution to a final concentration of 0.5 M NaCl, followed by centrifugation at 7000 xg for 15 min. The resultant pellet is washed again using 0.5M NaCl, 100 mM Tris, 50 mM EDTA, pH 7.4.

The resulting washed inclusion bodies are solubilized with 1.5 M guanidine hydrochloride (GuHCl) for 2-4 hours. After 7000 xg centrifugation for 15 min., the pellet is discarded and the polypeptide containing supernatant is incubated at 4°C overnight to allow further GuHCl extraction.

10
15
20
25
30
35
40
45
50
55

Following high speed centrifugation (30,000 xg) to remove insoluble particles, the GuHCl solubilized protein is refolded by quickly mixing the GuHCl extract with 20 volumes of buffer containing 50 mM sodium, pH 4.5, 150 mM NaCl, 2 mM EDTA by vigorous stirring. The refolded diluted protein solution is kept at 4°C without mixing for 12 hours prior to further purification steps.

To clarify the refolded polypeptide solution, a previously prepared tangential filtration unit equipped with 0.16 µm membrane filter with appropriate surface area (e.g., Filtron), equilibrated with 40 mM sodium acetate, pH 6.0 is employed. The filtered sample is loaded onto a cation exchange resin (e.g., Poros HS-50, Perseptive Biosystems). The column is washed with 40 mM sodium acetate, pH 6.0 and eluted with 250 mM, 500 mM, 1000 mM, and 1500 mM NaCl in the same buffer, in a stepwise manner. The absorbance at 280 nm of the effluent is continuously monitored. Fractions are collected and further analyzed by SDS-PAGE.

Fractions containing the polypeptide are then pooled and mixed with 4 volumes of water. The diluted sample is then loaded onto a previously prepared set of tandem columns of strong anion (Poros HQ-50, Perseptive Biosystems) and weak anion (Poros CM-20, Perseptive Biosystems) exchange resins. The columns are equilibrated with 40 mM sodium acetate, pH 6.0. Both columns are washed with 40 mM sodium acetate, pH 6.0, 200 mM NaCl. The CM-20 column is then eluted using a 10 column volume linear gradient ranging from 0.2 M NaCl, 50 mM sodium acetate, pH 6.0 to 1.0 M NaCl, 50 mM sodium acetate, pH 6.5. Fractions are collected under constant A₂₈₀ monitoring of the effluent. Fractions containing the polypeptide (determined, for instance, by 16% SDS-PAGE) are then pooled.

The resultant polypeptide should exhibit greater than 95% purity after the above refolding and purification steps. No major contaminant bands should be observed from Commassie blue stained 16% SDS-PAGE gel when 5 µg of purified protein is loaded. The purified protein can also be tested for endotoxin/LPS contamination, and typically the LPS content is less than 0.1 ng/ml according to LAL assays.

Example 7: Cloning and Expression of a Polypeptide in a Baculovirus Expression System

In this example, the plasmid shuttle vector pA2 is used to insert a polynucleotide into a baculovirus to express a polypeptide. This expression vector contains the strong polyhedrin promoter of the *Autographa californica* nuclear polyhedrosis virus (AcMNPV) followed by convenient restriction sites such as BamHI, Xba I and Asp718. The polyadenylation site of the simian virus 40 ("SV40") is used for efficient polyadenylation. For easy selection of recombinant virus, the plasmid contains the beta-galactosidase gene from *E. coli* under control of a weak *Drosophila* promoter in the same orientation, followed by the polyadenylation signal of the polyhedrin gene. The inserted genes are flanked on both sides by viral sequences for cell-mediated homologous recombination with wild-type viral DNA to generate a viable virus that express the cloned polynucleotide.

Many other baculovirus vectors can be used in place of the vector above, such as pAc373, pVL941, and pAcIM1, as one skilled in the art would readily appreciate, as long as the construct provides appropriately located signals for transcription, translation, secretion and the like, including a signal peptide and an in-frame AUG as required. Such vectors are described, for instance, in Luckow et al., *Virology* 170:31-39 (1989).

Specifically, the cDNA sequence contained in the deposited clone, including the AUG initiation codon and the naturally associated leader sequence identified in Table 1, is amplified using the PCR protocol described in Example 1. If the naturally occurring signal sequence is used to produce the secreted protein, the pA2 vector does not need a second signal peptide. Alternatively, the vector can be modified (pA2 GP) to include a baculovirus leader sequence, using the standard methods described in Summers et al., "A Manual of Methods for Baculovirus Vectors and Insect Cell Culture Procedures," Texas Agricultural Experimental Station Bulletin No. 1555 (1987).

The amplified fragment is isolated from a 1% agarose gel using a commercially available kit ("Geneclean," BIO 101 Inc., La Jolla, Ca.). The fragment then is digested with appropriate restriction enzymes and again purified on a 1% agarose gel.

5 The plasmid is digested with the corresponding restriction enzymes and optionally, can be dephosphorylated using calf intestinal phosphatase, using routine
10 procedures known in the art. The DNA is then isolated from a 1% agarose gel using a commercially available kit ("GeneClean" BIO 101 Inc., La Jolla, Ca.).

5 The fragment and the dephosphorylated plasmid are ligated together with T4 DNA ligase. *E. coli* HB101 or other suitable *E. coli* hosts such as XL-1 Blue
15 (Stratagene Cloning Systems, La Jolla, CA) cells are transformed with the ligation mixture and spread on culture plates. Bacteria containing the plasmid are identified by digesting DNA from individual colonies and analyzing the digestion product by
20 gel electrophoresis. The sequence of the cloned fragment is confirmed by DNA sequencing.

Five µg of a plasmid containing the polynucleotide is co-transfected with 1.0
25 µg of a commercially available linearized baculovirus DNA ("BaculoGold™ baculovirus DNA", Pharmingen, San Diego, CA), using the lipofection method described by Felgner et al., Proc. Natl. Acad. Sci. USA 84:7413-7417 (1987). One µg
15 of BaculoGold™ virus DNA and 5 µg of the plasmid are mixed in a sterile well of a microtiter plate containing 50 µl of serum-free Grace's medium (Life Technologies Inc., Gaithersburg, MD). Afterwards, 10 µl Lipofectin plus 90 µl Grace's medium are
30 added, mixed and incubated for 15 minutes at room temperature. Then the transfection mixture is added drop-wise to Sf9 insect cells (ATCC CRL 1711) seeded
20 in a 35 mm tissue culture plate with 1 ml Grace's medium without serum. The plate is then incubated for 5 hours at 27° C. The transfection solution is then removed from the plate and 1 ml of Grace's insect medium supplemented with 10% fetal calf serum
35 is added. Cultivation is then continued at 27° C for four days.

40 After four days the supernatant is collected and a plaque assay is performed, as described by Summers and Smith, *supra*. An agarose gel with "Blue Gal" (Life Technologies Inc., Gaithersburg) is used to allow easy identification and isolation of
45 gal-expressing clones, which produce blue-stained plaques. (A detailed description of a "plaque assay" of this type can also be found in the user's guide for insect cell culture and baculovirology distributed by Life Technologies Inc., Gaithersburg, page
30 9-10.) After appropriate incubation, blue stained plaques are picked with the tip of a micropipettor (e.g., Eppendorf). The agar containing the recombinant viruses is then
50

resuspended in a microcentrifuge tube containing 200 μ l of Grace's medium and the suspension containing the recombinant baculovirus is used to infect Sf9 cells seeded in 35 mm dishes. Four days later the supernatants of these culture dishes are harvested and then they are stored at 4° C.

To verify the expression of the polypeptide, Sf9 cells are grown in Grace's medium supplemented with 10% heat-inactivated FBS. The cells are infected with the recombinant baculovirus containing the polynucleotide at a multiplicity of infection ("MOI") of about 2. If radiolabeled proteins are desired, 6 hours later the medium is removed and is replaced with SF900 II medium minus methionine and cysteine (available from Life Technologies Inc., Rockville, MD). After 42 hours, 5 μ Ci of 35 S-methionine and 5 μ Ci 35 S-cysteine (available from Amersham) are added. The cells are further incubated for 16 hours and then are harvested by centrifugation. The proteins in the supernatant as well as the intracellular proteins are analyzed by SDS-PAGE followed by autoradiography (if radiolabeled).

Microsequencing of the amino acid sequence of the amino terminus of purified protein may be used to determine the amino terminal sequence of the produced protein.

Example 8: Expression of a Polypeptide in Mammalian Cells

The polypeptide of the present invention can be expressed in a mammalian cell. A typical mammalian expression vector contains a promoter element, which mediates the initiation of transcription of mRNA, a protein coding sequence, and signals required for the termination of transcription and polyadenylation of the transcript. Additional elements include enhancers, Kozak sequences and intervening sequences flanked by donor and acceptor sites for RNA splicing. Highly efficient transcription is achieved with the early and late promoters from SV40, the long terminal repeats (LTRs) from Retroviruses, e.g., RSV, HTLV1, HIV1 and the early promoter of the cytomegalovirus (CMV). However, cellular elements can also be used (e.g., the human actin promoter).

Suitable expression vectors for use in practicing the present invention include, for example, vectors such as pSVL and pMSG (Pharmacia, Uppsala, Sweden), pRSVcat (ATCC 37152), pSV2chfr (ATCC 37146), pBC12MI (ATCC 67109),

pCMVSPORT 2.0, and pCMVSPORT 3.0. Mammalian host cells that could be used include, human HeLa, 293, H9 and Jurkat cells, mouse NIH3T3 and C127 cells, Cos 1, Cos 7 and CV1, quail QC1-3 cells, mouse L cells and Chinese hamster ovary (CHO) cells.

Alternatively, the polypeptide can be expressed in stable cell lines containing the polynucleotide integrated into a chromosome. The co-transfection with a selectable marker such as dhfr, gpt, neomycin, hygromycin allows the identification and isolation of the transfected cells.

The transfected gene can also be amplified to express large amounts of the encoded protein. The DHFR (dihydrofolate reductase) marker is useful in developing cell lines that carry several hundred or even several thousand copies of the gene of interest. (See, e.g., Alt, F. W., et al., *J. Biol. Chem.* 253:1357-1370 (1978); Hamlin, J. L. and Ma, C., *Biochem. et Biophys. Acta*, 1097:107-143 (1990); Page, M. J. and Sydenham, M. A., *Biotechnology* 9:64-68 (1991).) Another useful selection marker is the enzyme glutamine synthase (GS) (Murphy et al., *Biochem J.* 227:277-279 (1991); Bebbington et al., *Bio/Technology* 10:169-175 (1992). Using these markers, the mammalian cells are grown in selective medium and the cells with the highest resistance are selected. These cell lines contain the amplified gene(s) integrated into a chromosome. Chinese hamster ovary (CHO) and NSO cells are often used for the production of proteins.

Derivatives of the plasmid pSV2-dhfr (ATCC Accession No. 37146), the expression vectors pC4 (ATCC Accession No. 209646) and pC6 (ATCC Accession No. 209647) contain the strong promoter (LTR) of the Rous Sarcoma Virus (Cullen et al., *Molecular and Cellular Biology*, 438-447 (March, 1985)) plus a fragment of the CMV-enhancer (Boshart et al., *Cell* 41:521-530 (1985).) Multiple cloning sites, e.g., with the restriction enzyme cleavage sites BamHI, XbaI and Asp718, facilitate the cloning of the gene of interest. The vectors also contain the 3' intron, the polyadenylation and termination signal of the rat preproinsulin gene, and the mouse DHFR gene under control of the SV40 early promoter.

Specifically, the plasmid pC6, for example, is digested with appropriate restriction enzymes and then dephosphorylated using calf intestinal phosphates by procedures known in the art. The vector is then isolated from a 1% agarose gel.

5 A polynucleotide of the present invention is amplified according to the
protocol outlined in Example 1. If the naturally occurring signal sequence is used to
10 produce the secreted protein, the vector does not need a second signal peptide.

Alternatively, if the naturally occurring signal sequence is not used, the vector can be
5 modified to include a heterologous signal sequence. (See, e.g., WO 96/34891.)

The amplified fragment is isolated from a 1% agarose gel using a
15 commercially available kit ("GeneClean," BIO 101 Inc., La Jolla, Ca.). The fragment
then is digested with appropriate restriction enzymes and again purified on a 1%
agarose gel.

20 The amplified fragment is then digested with the same restriction enzyme and
purified on a 1% agarose gel. The isolated fragment and the dephosphorylated vector
are then ligated with T4 DNA-ligase. *E. coli* HB 101 or XL-1 Blue cells are then
transformed and bacteria are identified that contain the fragment inserted into plasmid
25 pC6 using, for instance, restriction enzyme analysis.

30 Chinese hamster ovary cells lacking an active DHFR gene is used for
transfection. Five μ g of the expression plasmid pC6 is cotransfected with 0.5 μ g of
the plasmid pSVneo using lipofectin (Felgner et al., *supra*). The plasmid pSV2-neo
contains a dominant selectable marker, the *neo* gene from Tn5 encoding an enzyme
that confers resistance to a group of antibiotics including G418. The cells are seeded
20 in alpha minus MEM supplemented with 1 mg/ml G418. After 2 days, the cells are
trypsinized and seeded in hybridoma cloning plates (Greiner, Germany) in alpha
minus MEM supplemented with 10, 25, or 50 ng/ml of methotrexate plus 1 mg/ml
35 G418. After about 10-14 days single clones are trypsinized and then seeded in 6-well
petri dishes or 10 ml flasks using different concentrations of methotrexate (50 nM,
40 100 nM, 200 nM, 400 nM, 800 nM). Clones growing at the highest concentrations of
methotrexate are then transferred to new 6-well plates containing even higher
concentrations of methotrexate (1 μ M, 2 μ M, 5 μ M, 10 mM, 20 mM). The same
45 procedure is repeated until clones are obtained which grow at a concentration of 100 -
200 μ M. Expression of the desired gene product is analyzed, for instance, by SDS-
30 PAGE and Western blot or by reversed phase HPLC analysis.

50 Example 9: Protein Fusions

5
10
15
20
25
The polypeptides of the present invention are preferably fused to other proteins. These fusion proteins can be used for a variety of applications. For example, fusion of the present polypeptides to His-tag, HA-tag, protein A, IgG domains, and maltose binding protein facilitates purification. (See Example 5; see also EP A 394,827; Traunecker, et al., Nature 331:84-86 (1988).) Similarly, fusion to IgG-1, IgG-3, and albumin increases the half-life time in vivo. Nuclear localization signals fused to the polypeptides of the present invention can target the protein to a specific subcellular localization, while covalent heterodimer or homodimers can increase or decrease the activity of a fusion protein. Fusion proteins can also create chimeric molecules having more than one function. Finally, fusion proteins can increase solubility and/or stability of the fused protein compared to the non-fused protein. All of the types of fusion proteins described above can be made by modifying the following protocol, which outlines the fusion of a polypeptide to an IgG molecule, or the protocol described in Example 5.

15
20
25
30
Briefly, the human Fc portion of the IgG molecule can be PCR amplified, using primers that span the 5' and 3' ends of the sequence described below. These primers also should have convenient restriction enzyme sites that will facilitate cloning into an expression vector, preferably a mammalian expression vector.

35
40
45
50
For example, if pC4 (Accession No. 209646) is used, the human Fc portion can be ligated into the BamHI cloning site. Note that the 3' BamHI site should be destroyed. Next, the vector containing the human Fc portion is re-restricted with BamHI, linearizing the vector, and a polynucleotide of the present invention, isolated by the PCR protocol described in Example 1, is ligated into this BamHI site. Note that the polynucleotide is cloned without a stop codon, otherwise a fusion protein will not be produced.

55
If the naturally occurring signal sequence is used to produce the secreted protein, pC4 does not need a second signal peptide. Alternatively, if the naturally occurring signal sequence is not used, the vector can be modified to include a heterologous signal sequence. (See, e.g., WO 96/34891.)

Example 10: Production of an Antibody from a Polypeptide

30 The antibodies of the present invention can be prepared by a variety of
methods. (See, Current Protocols, Chapter 2.) For example, cells expressing a
20 polypeptide of the present invention is administered to an animal to induce the
35 production of sera containing polyclonal antibodies. In a preferred method, a
preparation of the secreted protein is prepared and purified to render it substantially
free of natural contaminants. Such a preparation is then introduced into an animal in
order to produce polyclonal antisera of greater specific activity.

40 25 In the most preferred method, the antibodies of the present invention are
monoclonal antibodies (or protein binding fragments thereof). Such monoclonal
antibodies can be prepared using hybridoma technology. (Köhler et al., Nature
45 256:495 (1975); Köhler et al., Eur. J. Immunol. 6:511 (1976); Köhler et al., Eur. J.
Immunol. 6:292 (1976); Hammerling et al., in: Monoclonal Antibodies and T-Cell
30 Hybridomas, Elsevier, N.Y., pp. 563-681 (1981).) In general, such procedures
involve immunizing an animal (preferably a mouse) with polypeptide or, more
50 preferably, with a secreted polypeptide-expressing cell. Such cells may be cultured in

any suitable tissue culture medium; however, it is preferable to culture cells in Earle's modified Eagle's medium supplemented with 10% fetal bovine serum (inactivated at about 56°C), and supplemented with about 10 g/l of nonessential amino acids, about 1,000 U/ml of penicillin, and about 100 µg/ml of streptomycin.

The splenocytes of such mice are extracted and fused with a suitable myeloma cell line. Any suitable myeloma cell line may be employed in accordance with the present invention; however, it is preferable to employ the parent myeloma cell line (SP2O), available from the ATCC. After fusion, the resulting hybridoma cells are selectively maintained in HAT medium, and then cloned by limiting dilution as described by Wands et al. (Gastroenterology 80:225-232 (1981).) The hybridoma cells obtained through such a selection are then assayed to identify clones which secrete antibodies capable of binding the polypeptide.

Alternatively, additional antibodies capable of binding to the polypeptide can be produced in a two-step procedure using anti-idiotypic antibodies. Such a method makes use of the fact that antibodies are themselves antigens, and therefore, it is possible to obtain an antibody which binds to a second antibody. In accordance with this method, protein specific antibodies are used to immunize an animal, preferably a mouse. The splenocytes of such an animal are then used to produce hybridoma cells, and the hybridoma cells are screened to identify clones which produce an antibody whose ability to bind to the protein-specific antibody can be blocked by the polypeptide. Such antibodies comprise anti-idiotypic antibodies to the protein-specific antibody and can be used to immunize an animal to induce formation of further protein-specific antibodies.

It will be appreciated that Fab and F(ab')₂ and other fragments of the antibodies of the present invention may be used according to the methods disclosed herein. Such fragments are typically produced by proteolytic cleavage, using enzymes such as papain (to produce Fab fragments) or pepsin (to produce F(ab')₂ fragments). Alternatively, secreted protein-binding fragments can be produced through the application of recombinant DNA technology or through synthetic chemistry.

For in vivo use of antibodies in humans, it may be preferable to use "humanized" chimeric monoclonal antibodies. Such antibodies can be produced

5 using genetic constructs derived from hybridoma cells producing the monoclonal
antibodies described above. Methods for producing chimeric antibodies are known in
10 the art. (See, for review, Morrison, Science 229:1202 (1985); Oi et al.,
BioTechniques 4:214 (1986); Cabilly et al., U.S. Patent No. 4,816,567; Taniguchi et
5 al., EP 171496; Morrison et al., EP 173494; Neuberger et al., WO 8601533; Robinson
et al., WO 8702671; Boulianne et al., Nature 312:643 (1984); Neuberger et al., Nature
15 314:268 (1985).)

Example 11: Production Of Secreted Protein For High-Throughput Screening
10 **Assays**

The following protocol produces a supernatant containing a polypeptide to be
tested. This supernatant can then be used in the Screening Assays described in
Examples 13-20.

25 First, dilute Poly-D-Lysine (644 587 Boehringer-Mannheim) stock solution
15 (1mg/ml in PBS) 1:20 in PBS (w/o calcium or magnesium 17-516F Biowhittaker) for
a working solution of 50ug/ml. Add 200 ul of this solution to each well (24 well
plates) and incubate at RT for 20 minutes. Be sure to distribute the solution over each
30 well (note: a 12-channel pipetter may be used with tips on every other channel).
Aspirate off the Poly-D-Lysine solution and rinse with 1ml PBS (Phosphate Buffered
20 Saline). The PBS should remain in the well until just prior to plating the cells and
plates may be poly-lysine coated in advance for up to two weeks.

35 Plate 293T cells (do not carry cells past P+20) at 2×10^5 cells/well in .5ml
DMEM(Dulbecco's Modified Eagle Medium)(with 4.5 G/L glucose and L-glutamine
(12-604F Biowhittaker))/10% heat inactivated FBS(14-503F Biowhittaker)/1x
40 Penstrep(17-602E Biowhittaker). Let the cells grow overnight.

The next day, mix together in a sterile solution basin: 300 ul Lipofectamine
(18324-012 Gibco/BRL) and 5ml Optimem I (31985070 Gibco/BRL)/96-well plate.
45 With a small volume multi-channel pipetter, aliquot approximately 2ug of an
expression vector containing a polynucleotide insert, produced by the methods
30 described in Examples 8 or 9, into an appropriately labeled 96-well round bottom
plate. With a multi-channel pipetter, add 50ul of the Lipofectamine/Optimem I
50 mixture to each well. Pipette up and down gently to mix. Incubate at RT 15-45

minutes. After about 20 minutes, use a multi-channel pipetter to add 150ul Optimem I to each well. As a control, one plate of vector DNA lacking an insert should be transfected with each set of transfections.

Preferably, the transfection should be performed by tag-teaming the following tasks. By tag-teaming, hands on time is cut in half, and the cells do not spend too much time on PBS. First, person A aspirates off the media from four 24-well plates of cells, and then person B rinses each well with .5-1ml PBS. Person A then aspirates off PBS rinse, and person B, using a 12-channel pipetter with tips on every other channel, adds the 200ul of DNA/Lipofectamine/Optimem I complex to the odd wells first, then to the even wells, to each row on the 24-well plates. Incubate at 37°C for 6 hours.

While cells are incubating, prepare appropriate media, either 1%BSA in DMEM with 1x penstrep, or CHO-5 media (116.6 mg/L of CaCl₂ (anhyd); 0.00130 mg/L CuSO₄·5H₂O; 0.050 mg/L of Fe(NO₃)₃·9H₂O; 0.417 mg/L of FeSO₄·7H₂O; 311.80 mg/L of KCl; 28.64 mg/L of MgCl₂; 48.84 mg/L of MgSO₄; 6995.50 mg/L of NaCl; 2400.0 mg/L of NaHCO₃; 62.50 mg/L of NaH₂PO₄·H₂O; 71.02 mg/L of Na₂HPO₄; 4320 mg/L of ZnSO₄·7H₂O; .002 mg/L of Arachidonic Acid; 1.022 mg/L of Cholesterol; .070 mg/L of DL-alpha-Tocopherol-Acetate; 0.0520 mg/L of Linoleic Acid; 0.010 mg/L of Linolenic Acid; 0.010 mg/L of Myristic Acid; 0.010 mg/L of Oleic Acid; 0.010 mg/L of Palmitic Acid; 0.010 mg/L of Palmitic Acid; 100 mg/L of Pluronic F-68; 0.010 mg/L of Stearic Acid; 2.20 mg/L of Tween 80; 4551 mg/L of D-Glucose; 130.85 mg/ml of L- Alanine; 147.50 mg/ml of L-Arginine-HCL; 7.50 mg/ml of L-Asparagine-H₂O; 6.65 mg/ml of L-Aspartic Acid; 29.56 mg/ml of L-Cystine-2HCL-H₂O; 31.29 mg/ml of L-Cystine-2HCL; 7.35 mg/ml of L-Glutamic Acid; 365.0 mg/ml of L-Glutamine; 18.75 mg/ml of Glycine; 52.48 mg/ml of L-Histidine-HCL-H₂O; 106.97 mg/ml of L-Isoleucine; 111.45 mg/ml of L-Leucine; 163.75 mg/ml of L-Lysine HCL; 32.34 mg/ml of L-Methionine; 68.48 mg/ml of L-Phenylalanine; 40.0 mg/ml of L-Proline; 26.25 mg/ml of L-Serine; 101.05 mg/ml of L-Threonine; 19.22 mg/ml of L-Tryptophan; 91.79 mg/ml of L-Tyrosine-2Na-2H₂O; 99.65 mg/ml of L-Valine; 0.0035 mg/L of Biotin; 3.24 mg/L of D-Ca Pantothenate; 11.78 mg/L of Choline Chloride; 4.65 mg/L of Folic Acid; 15.60 mg/L of i-Inositol; 3.02 mg/L of Niacinamide; 3.00 mg/L of Pyridoxal HCL; 0.031 mg/L of Pyridoxine HCL; 0.319

5 mg/L of Riboflavin; 3.17 mg/L of Thiamine HCL; 0.365 mg/L of Thymidine; and
0.680 mg/L of Vitamin B₁₂; 25 mM of HEPES Buffer; 2.39 mg/L of Na
10 Hypoxanthine; 0.105 mg/L of Lipoic Acid; 0.081 mg/L of Sodium Putrescine-2HCL;
55.0 mg/L of Sodium Pyruvate; 0.0067 mg/L of Sodium Selenite; 20uM of
5 Ethanolamine; 0.122 mg/L of Ferric Citrate; 41.70 mg/L of Methyl-B-Cyclodextrin
complexed with Linoleic Acid; 33.33 mg/L of Methyl-B-Cyclodextrin complexed
15 with Oleic Acid; and 10 mg/L of Methyl-B-Cyclodextrin complexed with Retinal)
with 2mm glutamine and 1x penstrep. (BSA (81-068-3 Bayer) 100gm dissolved in 1L
DMEM for a 10% BSA stock solution). Filter the media and collect 50 ul for
20 endotoxin assay in 15ml polystyrene conical.

The transfection reaction is terminated, preferably by tag-teaming, at the end
of the incubation period. Person A aspirates off the transfection media, while person
B adds 1.5ml appropriate media to each well. Incubate at 37°C for 45 or 72 hours
25 depending on the media used: 1%BSA for 45 hours or CHO-5 for 72 hours.

15 On day four, using a 300ul multichannel pipetter, aliquot 600ul in one 1ml
deep well plate and the remaining supernatant into a 2ml deep well. The supernatants
from each well can then be used in the assays described in Examples 13-20.

30 It is specifically understood that when activity is obtained in any of the assays
described below using a supernatant, the activity originates from either the
20 polypeptide directly (e.g., as a secreted protein) or by the polypeptide inducing
35 expression of other proteins, which are then secreted into the supernatant. Thus, the
invention further provides a method of identifying the protein in the supernatant
characterized by an activity in a particular assay.

40 25 Example 12: Construction of GAS Reporter Construct

One signal transduction pathway involved in the differentiation and
proliferation of cells is called the Jaks-STATs pathway. Activated proteins in the
45 Jaks-STATs pathway bind to gamma activation site "GAS" elements or interferon-
sensitive responsive element ("ISRE"), located in the promoter of many genes. The
30 binding of a protein to these elements alter the expression of the associated gene.

GAS and ISRE elements are recognized by a class of transcription factors
50 called Signal Transducers and Activators of Transcription, or "STATs." There are six

5 members of the STATs family. Stat1 and Stat3 are present in many cell types, as is
10 Stat2 (as response to IFN-alpha is widespread). Stat4 is more restricted and is not in
many cell types though it has been found in T helper class I, cells after treatment with
IL-12. Stat5 was originally called mammary growth factor, but has been found at
5 higher concentrations in other cells including myeloid cells. It can be activated in
tissue culture cells by many cytokines.

15 The STATs are activated to translocate from the cytoplasm to the nucleus
upon tyrosine phosphorylation by a set of kinases known as the Janus Kinase ("Jaks")
family. Jaks represent a distinct family of soluble tyrosine kinases and include Tyk2,
20 Jak1, Jak2, and Jak3. These kinases display significant sequence similarity and are
generally catalytically inactive in resting cells.

The Jaks are activated by a wide range of receptors summarized in the Table
below. (Adapted from review by Schidler and Darnell, Ann. Rev. Biochem. 64:621-
25 51 (1995).) A cytokine receptor family, capable of activating Jaks, is divided into two
15 groups: (a) Class 1 includes receptors for IL-2, IL-3, IL-4, IL-6, IL-7, IL-9, IL-11, IL-
12, IL-15, Epo, PRL, GH, G-CSF, GM-CSF, LIF, CNTF, and thrombopoietin; and (b)
Class 2 includes IFN-a, IFN-g, and IL-10. The Class 1 receptors share a conserved
30 cysteine motif (a set of four conserved cysteines and one tryptophan) and a WSXWS
motif (a membrane proximal region encoding Trp-Ser-Xxx-Trp-Ser (SEQ ID NO:2)).

20 Thus, on binding of a ligand to a receptor, Jaks are activated, which in turn
activate STATs, which then translocate and bind to GAS elements. This entire
35 process is encompassed in the Jaks-STATs signal transduction pathway.

Therefore, activation of the Jaks-STATs pathway, reflected by the binding of
40 the GAS or the ISRE element, can be used to indicate proteins involved in the
25 proliferation and differentiation of cells. For example, growth factors and cytokines
are known to activate the Jaks-STATs pathway. (See Table below.) Thus, by using
GAS elements linked to reporter molecules, activators of the Jaks-STATs pathway
45 can be identified.

To construct a synthetic GAS containing promoter element, which is used in the Biological Assays described in Examples 13-14, a PCR based strategy is employed to generate a GAS-SV40 promoter sequence. The 5' primer contains four tandem copies of the GAS binding site found in the IRF1 promoter and previously demonstrated to bind STATs upon induction with a range of cytokines (Rothman et al., Immunity 1:457-468 (1994).), although other GAS or ISRE elements can be used instead. The 5' primer also contains 18bp of sequence complementary to the SV40 early promoter sequence and is flanked with an XhoI site. The sequence of the 5' primer is:

5':GCGCCTCGAGATTTCCCGAAATCTAGATTTCCCGAAATGATTTCGCCGAAATGATTTCGCCGAAATATCTGCCATCTCAATTAG:3' (SEQ ID NO:3)

The downstream primer is complementary to the SV40 promoter and is flanked with a Hind III site: 5':GCGGCAAGCTTTTTGCAAAGCCTAGGC:3' (SEQ ID NO:4)

PCR amplification is performed using the SV40 promoter template present in the B-gal:promoter plasmid obtained from Clontech. The resulting PCR fragment is digested with XhoI/Hind III and subcloned into BLSK2-. (Stratagene.) Sequencing with forward and reverse primers confirms that the insert contains the following sequence:

5':CTCGAGATTTCCCGAAATCTAGATTTCCCGAAATGATTTCGCCGAAATGATTTCGCCGAAATATCTGCCATCTCAATTAGTCAGCAACCATAGTCCCGCCCTAACTCCGCCCATCCCGCCCTAACTCCGCCAGTTCCGCCCATTTCTCCGCCCCATGGCTGACTAATTTTTTTATTTATGCAGAGGCCGAGGCCGCTCGGCCTCTGAGCTATCCAGAAGTAGTGAGGAGGCTTTTTTGGAGGCCTAGGCTTTTGCAAAAAGCTT:3' (SEQ ID NO:5)

With this GAS promoter element linked to the SV40 promoter, a GAS:SEAP2 reporter construct is next engineered. Here, the reporter molecule is a secreted alkaline phosphatase, or "SEAP." Clearly, however, any reporter molecule can be instead of SEAP, in this or in any of the other Examples. Well known reporter molecules that can be used instead of SEAP include chloramphenicol acetyltransferase (CAT), luciferase, alkaline phosphatase, B-galactosidase, green fluorescent protein (GFP), or any protein detectable by an antibody.

5 The above sequence confirmed synthetic GAS-SV40 promoter element is
subcloned into the pSEAP-Promoter vector obtained from Clontech using HindIII and
10 XhoI, effectively replacing the SV40 promoter with the amplified GAS:SV40
promoter element, to create the GAS-SEAP vector. However, this vector does not
5 contain a neomycin resistance gene, and therefore, is not preferred for mammalian
expression systems.

15 Thus, in order to generate mammalian stable cell lines expressing the GAS-
SEAP reporter, the GAS-SEAP cassette is removed from the GAS-SEAP vector using
SalI and NotI, and inserted into a backbone vector containing the neomycin resistance
20 gene, such as pGFP-1 (Clontech), using these restriction sites in the multiple cloning
site, to create the GAS-SEAP/Neo vector. Once this vector is transfected into
mammalian cells, this vector can then be used as a reporter molecule for GAS binding
as described in Examples 13-14.

25 Other constructs can be made using the above description and replacing GAS
15 with a different promoter sequence. For example, construction of reporter molecules
containing NFK-B and EGR promoter sequences are described in Examples 15 and
16. However, many other promoters can be substituted using the protocols described
30 in these Examples. For instance, SRE, IL-2, NFAT, or Osteocalcin promoters can be
substituted, alone or in combination (e.g., GAS/NF-KB/EGR, GAS/NF-KB, IL-
20 2/NFAT, or NF-KB/GAS). Similarly, other cell lines can be used to test reporter
construct activity, such as HELA (epithelial), HUVEC (endothelial), Reh (B-cell),
35 Saos-2 (osteoblast), HUVAC (aortic), or Cardiomyocyte.

40 **Example 13: High-Throughput Screening Assay for T-cell Activity.**

25 The following protocol is used to assess T-cell activity by identifying factors,
such as growth factors and cytokines, that may proliferate or differentiate T-cells. T-
cell activity is assessed using the GAS/SEAP/Neo construct produced in Example 12.
45 Thus, factors that increase SEAP activity indicate the ability to activate the Jaks-
STATS signal transduction pathway. The T-cell used in this assay is Jurkat T-cells
30 (ATCC Accession No. TIB-152), although Molt-3 cells (ATCC Accession No. CRL-
1552) and Molt-4 cells (ATCC Accession No. CRL-1582) cells can also be used.

Jurkat T-cells are lymphoblastic CD4+ Th1 helper cells. In order to generate stable cell lines, approximately 2 million Jurkat cells are transfected with the GAS-SEAP/neo vector using DMRIE-C (Life Technologies)(transfection procedure described below). The transfected cells are seeded to a density of approximately 20,000 cells per well and transfectants resistant to 1 mg/ml gentamicin selected. Resistant colonies are expanded and then tested for their response to increasing concentrations of interferon gamma. The dose response of a selected clone is demonstrated.

Specifically, the following protocol will yield sufficient cells for 75 wells containing 200 ul of cells. Thus, it is either scaled up, or performed in multiple to generate sufficient cells for multiple 96 well plates. Jurkat cells are maintained in RPMI + 10% serum with 1%Pen-Strep. Combine 2.5 mls of OPTI-MEM (Life Technologies) with 10 ug of plasmid DNA in a T25 flask. Add 2.5 ml OPTI-MEM containing 50 ul of DMRIE-C and incubate at room temperature for 15-45 mins.

During the incubation period, count cell concentration, spin down the required number of cells (10^7 per transfection), and resuspend in OPTI-MEM to a final concentration of 10^7 cells/ml. Then add 1ml of 1×10^7 cells in OPTI-MEM to T25 flask and incubate at 37°C for 6 hrs. After the incubation, add 10 ml of RPMI + 15% serum.

The Jurkat:GAS-SEAP stable reporter lines are maintained in RPMI + 10% serum, 1 mg/ml Gentamicin, and 1% Pen-Strep. These cells are treated with supernatants containing a polypeptide as produced by the protocol described in Example 11.

On the day of treatment with the supernatant, the cells should be washed and resuspended in fresh RPMI + 10% serum to a density of 500,000 cells per ml. The exact number of cells required will depend on the number of supernatants being screened. For one 96 well plate, approximately 10 million cells (for 10 plates, 100 million cells) are required.

Transfer the cells to a triangular reservoir boat, in order to dispense the cells into a 96 well dish, using a 12 channel pipette. Using a 12 channel pipette, transfer 200 ul of cells into each well (therefore adding 100,000 cells per well).

After all the plates have been seeded, 50 ul of the supernatants are transferred directly from the 96 well plate containing the supernatants into each well using a 12 channel pipette. In addition, a dose of exogenous interferon gamma (0.1, 1.0, 10 ng) is added to wells H9, H10, and H11 to serve as additional positive controls for the assay.

The 96 well dishes containing Jurkat cells treated with supernatants are placed in an incubator for 48 hrs (note: this time is variable between 48-72 hrs). 35 ul samples from each well are then transferred to an opaque 96 well plate using a 12 channel pipette. The opaque plates should be covered (using sellophene covers) and stored at -20°C until SEAP assays are performed according to Example 17. The plates containing the remaining treated cells are placed at 4°C and serve as a source of material for repeating the assay on a specific well if desired.

As a positive control, 100 Unit/ml interferon gamma can be used which is known to activate Jurkat T cells. Over 30 fold induction is typically observed in the positive control wells.

The above protocol may be used in the generation of both transient, as well as, stable transfected cells, which would be apparent to those of skill in the art.

Example 14: High-Throughput Screening Assay Identifying Myeloid Activity

The following protocol is used to assess myeloid activity by identifying factors, such as growth factors and cytokines, that may proliferate or differentiate myeloid cells. Myeloid cell activity is assessed using the GAS/SEAP/Neo construct produced in Example 12. Thus, factors that increase SEAP activity indicate the ability to activate the Jaks-STATS signal transduction pathway. The myeloid cell used in this assay is U937, a pre-monocyte cell line, although TF-1, HL60, or KG1 can be used.

To transiently transfect U937 cells with the GAS/SEAP/Neo construct produced in Example 12, a DEAE-Dextran method (Kharbanda et. al., 1994, Cell Growth & Differentiation, 5:259-265) is used. First, harvest 2×10^7 U937 cells and wash with PBS. The U937 cells are usually grown in RPMI 1640 medium containing

10% heat-inactivated fetal bovine serum (FBS) supplemented with 100 units/ml penicillin and 100 mg/ml streptomycin.

Next, suspend the cells in 1 ml of 20 mM Tris-HCl (pH 7.4) buffer containing 0.5 mg/ml DEAE-Dextran, 8 ug GAS-SEAP2 plasmid DNA, 140 mM NaCl, 5 mM KCl, 375 uM Na₂HPO₄·7H₂O, 1 mM MgCl₂, and 675 uM CaCl₂. Incubate at 37°C for 45 min.

Wash the cells with RPMI 1640 medium containing 10% FBS and then resuspend in 10 ml complete medium and incubate at 37°C for 36 hr.

The GAS-SEAP/U937 stable cells are obtained by growing the cells in 400 ug/ml G418. The G418-free medium is used for routine growth but every one to two months, the cells should be re-grown in 400 ug/ml G418 for couple of passages.

These cells are tested by harvesting 1×10^8 cells (this is enough for ten 96-well plates assay) and wash with PBS. Suspend the cells in 200 ml above described growth medium, with a final density of 5×10^5 cells/ml. Plate 200 ul cells per well in the 96-well plate (or 1×10^5 cells/well).

Add 50 ul of the supernatant prepared by the protocol described in Example 11. Incubate at 37°C for 48 to 72 hr. As a positive control, 100 Unit/ml interferon gamma can be used which is known to activate U937 cells. Over 30 fold induction is typically observed in the positive control wells. SEAP assay the supernatant according to the protocol described in Example 17.

Example 15: High-Throughput Screening Assay Identifying Neuronal Activity.

When cells undergo differentiation and proliferation, a group of genes are activated through many different signal transduction pathways. One of these genes, EGR1 (early growth response gene 1), is induced in various tissues and cell types upon activation. The promoter of EGR1 is responsible for such induction. Using the EGR1 promoter linked to reporter molecules, activation of cells can be assessed.

Particularly, the following protocol is used to assess neuronal activity in PC12 cell lines. PC12 cells (rat phenochromocytoma cells) are known to proliferate and/or differentiate by activation with a number of mitogens, such as TPA (tetradecanoyl phorbol acetate), NGF (nerve growth factor), and EGF (epidermal growth factor).
